EXTRACT

From an Act prescribing Rules for the Government of the State Library, passed March 8th, 1861.

SECTION 11. The Librarian shall cause to be kept a register of all books issued and returned; and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof; and before the Controller shall issue his warrant in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance, or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library by him, and has settled all accounts for injuring such books or otherwise.

SEC. 15. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State who are required to keep their offices at the seat of government, the Justices of the Supreme Court, the Attorney-General, and the Trustees of the Library.

O. M. CLAYES, STATE PRINTER.

Mining and Scientific Press.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

IMPORTANT IMPROVEMENT IN BRICK WALLS.

The inventor, Mr. L. Goodrich, of San José, has furnished us the engravings for the accompanying illustration of his new and improved method of constructing brick walls, for which letters patent were granted to him in September last. All who are aware of the frail and dangerous manner in which a large portion of the brick walls of this city are constructed, for the sake of erecting cheap buildings, will be fully prepared to hail with great satisfaction any new arrangement which will add material strength to brick structures without greatly increasing their first cost. In this invention we have apparently this great desideratum, and, besides, a large reduction in cost.

Dampness in brick walls is well known to be a serious and obstinate difficulty, and hitherto all attempts to remedy the evil, by applying an outward coating of tar, or other material, have proved inefficient. A large portion of the dwellings in our city are made almost untenable by dampness, which it is impossible to exclude by solid walls. In fact, the prejudice on account of the unhealthiness of brick buildings is the cause of the erection of a large proportion of wooden dwellings in California. Mr. Goodrich's plan of building must certainly prevent all dampness from passing through the walls of brick and mortar buildings, and thus completely obviate this great objection. It is claimed that in a twelve-inch wall a saving is made of one-third in brick, mortar and labor; the hollow walls will sustain a much greater weight before springing than those of solid work, and are less liable to injury by earthquakes; they afford a fine facility for ventilation, and laying gas, water and soil pipes. Besides these are other advantages suggested by this invention, which we have not room to mention here, but which will be given by the patentee, in his circular, in some future number of the Press. The engraving shows the plan of construction very plainly. The fractures seen in figure 7 are simply to show that the full hight of each story is not illustrated. The following is the inventor's description of their

Goodrich's Patent Brick Walls.

construction for an ordinary building of two or three stories in hight, with walls say twelve inches thick:—

"The foundation walls, if of the ordinary hight, I would lay up in the usual style, solid, to the hight of the underside of the first tier of floor-beams, tying them in the usual way, or as hereafter described for the hollow walls. From this last named level (the under side of first tier of floor beams,) I build two four inch (half brick) walls, separated by an air space or chamber of four inches along the center of the wall. All the bricks being laid as stretchers with a full and perfect bond with each other up to the next tier of floor beams, introducing in the mortar joints at every third, fourth, or fifth course, or as often as may be thought best, as ties, strips of wood, or pieces of hoop iron, to tie the four inch walls together, to prevent them from separating or collapsing, and for other reasons hereinafter set forth. These strips I lay diagonally across from one four-inch wall to the other, as shown by engraving (Fig. 4), at an angle say of 45 degrees, or at a greater or less angle with the surface of the wall, as one may think best. In a building I have lately built, I introduced them in the following plan: I placed them in every fifth joint of mortar along on the wall, about a foot or ten inches apart, measuring parallel with and along the wall, and at angle with the face of the wall of about 45 degrees, laid upon the naked bricks, their ends extending near the inner and outer faces of the wall, and were buried in, and overlaid by the following joint of mortar and layer of bricks. The next course of ties, or braces of wood, are laid at the same angle to the face of the wall, but in the *opposite direction* from the preceding ties, and this rule I observe throughout the wall, the ties constantly alternating, appearing, when looking down the hollow space along the center of the wall, like lattice or herring-bone bridging between floor timbers, and giving the same character of support to the walls that such bridging does to floor beams, in addition to their tying the walls in every other direction.

Opposite, and at the end of every set of floor beams, above the foundation beams, and entirely about the buildings, as shown at Fig. 7, I build the wall solid the depth of the beams, excepting what is necessary for ventilation; as no dampness can penetrate, or do harm at this point, as the wall-plates would prevent all dampness going to the walls below it. This solid brick-work, of four or five courses, which it naturally would be, gives every facility necessary for anchoring the floor-beams to the exterior walls, and also distributes more equally the weight of the floor, roof, etc., over both the inside and outside walls, and makes both the inside and outside walls alike support the superstructure.

Thus far I have spoken of walls marked on my plans (Figures 4 and 7), after which style I should have no hesitation in carrying up walls to a greater hight than I should walls of the same thickness, built solid, the usual way, for my experience has satisfied me that they are much stronger.

The wooden ties I have thus far made use of were made from the common four feet sawed plasterer's laths, the usual width and thickness—about one and one half inch wide by full a quarter of an inch thick.

A cheaper and better way of making these ties would be to split them out as shingles are made, of some straight grained wood; the quantity necessary for a building is so small, the expense of them is but trifling. If hoop iron should be used, it will be seen then that the expense would not be great. But the wood is far preferable, as it is stiffer, and its bracing qualities are better.

For walls, for carrying great weights or of great hight, I should adopt the method shown by Figures 5, 6 or 8, that is to say, I would increase the inner or outer wall to a single brick wall (8-inch wall), or build three 4-inch walls (half brick walls), with two air spaces of any desired width, and let the laths or ties run diagonally across the three courses, as shown at Figure 5, or at Figure 8, with an 8 inch wall. Either of the last mentioned modes would answer for any place where a solid wall of the same thickness would answer.

I also give a method of building an 8-inch hollow wall, with hollow space or chamber of three inches, as shown at Figure 2, with bricks on edge. This, I contend, if well laid up and well tied, will make as strong, or a stronger wall, to resist any ordinary strain that small buildings are subject to, than the ordinary 8-inch solid wall, laid in the usual way, with a saving of more than one-third of the bricks

and one-half the mortar. Bringing the width of the bricks to view, with our present idea of proportion for brick work, would not be as pleasing as when laid the usual way; but where the house is designed to be stuccoed outside, this objection would be removed. I would further say, all exterior stuccoed or plastered work on walls constructed after my plans will not require to be painted in oil paints, as is the usual custom, thereby effecting a very great saving in expense in this particular, but may be tinted with any of the common water tints, as no harm can result from the dampness striking the stucco into the exterior bricks.

This mode of building hollow brick walls with brick on edge is an excellent one for partition walls. They are not only stronger, but a better protection against sound, heat, and cold, as the air space is an excellent non-conductor of either.

In building with bricks on edge for outside walls, I prefer the style shown at Figure 7, with the alternating isolated piers. This gives a wider base, and makes an excellent wall, and a very strong one, and is very easily built.

That shown at Figure 6 makes a still stronger wall, and is suitable for almost any building. Here the bricks are laid the usual way.

I have also, under the same patent, another method of tying for hollow walls, which consists of a large continuous wire, about the size of that used for telegraphing. This I run zig-zag from one wall to the other, as shown at Figure 1—lapping on each wall some three or four inches, and continuing about the building, or from opening to opening. It makes a good tie, and is valuable in many places."

Mr. Goodrich is an old resident of San José, and his skill as an architect and builder, we can safely say from personal observation, is well supported by many of the finest structures in Santa Clara county. We consider his invention one of great promise, and desire that its merits shall be thoroughly canvassed by our mechanical readers. His office is now located in this city, in the Mercantile Library Building, corner of Bush and Montgomery streets, where full information may be obtained concerning the sale of his patent right for town, county, and State use.

The "Gold Room" in Wall Street.

Our New York Correspondent in a private letter, makes the following allusion to gold speculators, under date of December 2d, 1864.

"Business does not improve much, although a little more commotion is perceptible. Stocks are remarkably quiet. Gold of course is the speculative feature. Ye Gods! what a sight the Gold Room presents to the uninitiated visitor; men half crazy, acting as though they were trying to jump over each other's heads, bellowing at the top of their voices, some dancing with delight at a sudden rise, another faints and is carried out, probably one who has lost his all. This is no exagerated account, it is what I have seen with my own eyes. For instance, in comes a new member of the board, perhaps a retired grocer, with plenty of the "essential," eyes wide open, mouth ditto, hat on the back of his head, crys out, I will take $50,000; sold, crys out another at that moment. The next news received might send it "flying up" on the market one or two per cent. Grocer, elated with his success, goes in more desperately, and then, nine out of ten, he looses; thus it goes on. The old hands at the business can tell, almost to a day, of a new operator, how long it will be before he will be broke, after seeing him operate once. I don't care who the man is, if he gets into the Gold Room to operate on his individual account, he is destined to be a ruined man. The ones who make the money are such as Auguste Belmont, Vanderbildt, Cook, etc., and Government Agents, who have the "inside" on the news, and the brokers who are satisfied with their commissions.

Phantom Boquets.—This is the most appropriate designation given to a class of boquets, a sample of which has been exhibited the past week in one of the windows in Tucker's Jewelry establishment, in this city. The boquet is composed of the white skeleton of various leaves, cleaned of all the colored and perishable parts. The skeletons retain the shape and indicate the general character of the original leaves; and with their delicate network of fibre, show beauties in the vegetable world not otherwise discoverable. The whiteness, the fineness of the filaments, and the transparency and graceful curves of the leaves, give to phantom boquets a kind of beauty not found in the fresh flower; and besides, when properly protected, they will last for years.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

WATER MEASUREMENT ONCE MORE.

Editors Mining and Scientific Press:—In reply to my answer of your correspondent "T. McA.," on the subject of water measurement and the water pressure engine of Hanshrow & Redding, Mr. "McA." endeavors to force upon the mining engineers of California a certain imaginary quantity of water as the discharge of one inch of water, miners' measure.

Because a certain self-constituted committee adopts a certain discharge of water—145 lbs per minute—as the unit of a miners' inch, which in reality does not deliver more than 97½ lbs per minute, proving thereby their utter ignorance of the very beginning of hydraulics, Mr. McA. labors under the impression that every mining engineer would bend his knees to such authority. If, as he says, my figures are correct, those of the committee must be entirely wrong; for they give results which are 36 per cent. higher than practice proves them. Why did he, being aware of the statement of the committee, not try to show them the fallacy of their result?

But I am prepared to prove what I say. Let us refer to the paragraph which my patronizing friend quotes: * * * "It was finally agreed (without regard to what ditch companies may sell as an inch of water) that in calculations for the construction of machinery, a miners' inch of water shall equal the amount of water that will pass through an opening one inch square, under a pressure of six inches, measured from the center of the orifice; or a body of water 336 feet long and one inch square, the amount which will pass through said orifice in a minute; or 145 86-100 lbs of water passing a given point in a minute." * * *

We see, by the above statement, that the committee adopts the discharge of a certain quantity of water through a lateral orifice one inch square under a pressure of six inches as the unit of a miners' inch. The sentence following: "or a body of water 336 feet long and one inch square" proves their utter ignorance of hydraulic principles. Now every one acquainted with hydraulics knows the phenomenon of the contracted vein; knows that the filaments of water do not run parallel at the orifice, but converge, assuming a parallel direction at a certain distance therefrom, while the section of the running water is only, in this particular case, 67-100 of a square inch, while the body of water discharged per minute would only be 0.95 x 336 = 319 feet long, about five per cent. being lost by friction. Now if we multiply said section by the length of water running from the orifice, supposing the section of the running stream to maintain its regular form, we get a discharge of 2,685 cubic inches per minute, or 94½ lbs, a result which corresponds very well with practise.

Is it not remarkable to see my polite friend overlook such glaring errors without a "growl?" Why does he not endeavor to overthrow erroneous rules set up by the authority of that committee instead of submitting to it? If, as he says, all the leading machine shops in the city, have adopted that stated imaginary discharge of 145 lbs per minute for every miners' inch, (a statement which I know to be incorrect,) it is very necessary to inform the miners and mill men of it, to guard them against imposition. If any of the machinists tell mill men that they can work, say 100 tons of ore with a certain number of inches, under a stated pressure, by a certain machine, it would be well for the mill men to know that he has to make an allowance of 36 per cent. on that estimate, that he is extremely fortunate if he can work 64 tons therewith.

The three or four points mentioned by my kind friend, as having an influence on the discharge, change the resulting quantity to some extent, perhaps in some cases as much as 10 per cent., but certainly in favor of the calculated power. Backwater, no miner allows if he can help it, and the fourth case mentioned, never takes place on any of the ditches I happened to be connected with.

Mr. McA. does not appear to be satisfied with the mode of measuring water for mechanical purposes, but when we consider the defined value of one inch of water, subject to very slight variations, also the fact that one hundred inches, as measured by the ditch companies, actually carry more than one hundred single inches of water, a fact in favor of the calculated power, such a change would barely be justified. In France, the inch of water discharged through a *round* lateral orifice of one inch in diameter has been a very convenient standard for hundreds of years.

In conclusion, my patronizing friend will perhaps, specify the exact collateral points of his "riddle," the size of the distributing reservoir, and the number and position of apertures, &c., in fact, every condition, which in his opinion is necessary to the full understanding of the case. In my professional connection with the oldest and most prominent ditch men, (Messrs. C. Marsh, Capt. Kidd, Whartenby, R. Morrow, Dr. Weaver, A. Laird, W. Ritter, and Pollard), the occurence of any such "riddle" has never been presented to me. I also deny the possibility of an occurrence of such a "riddle" if the ditch company measures the water properly through distributing reservoirs of proper sizes. Though the quantity of water, received by each individual mining company, decreases for a certain number of inches, as my friend says, if one or more of the companies stop buying water from the same distributing reservoir, it certainly does not follow that they should get a greater supply of water as is generally regulated by the sluice connecting the ditch with the distributing reservoir, generally made of wood. The supply in the above case is smaller because the water reaches the lateral orifice with less velocity. The case as it stands now is the following, taking figures easily understood by every reader: If $10 were equally divided among nine men we would suppose that every one would receive one and one-ninth of a dollar, but according to Mr. McA's riddle they do not get that sum, but even less than $1. Very queer, is it not? Yours truly

G. F. Deetken.

Markleeville Correspondence.

Editors Mining and Scientific Press:—Your correspondent is a constant reader of your valuable journal, and has taken great pleasure in reading the numerous articles found in its columns devoted to science and the mining interests of various portions of California and Nevada, and would be pleased to see, semi-occasionally, some notice taken of this portion of the country. We feel, here, that we are exalted (in point of altitude) above the rest of mankind, and should be looked up to somewhat by those who tread the lower walks of life; and as we are in the midst of a silver mining region which is destined, "in the course of human events," to rank second to none in all the land, we trust you will allow us a short space in the columns of your paper.

The county of Alpine is situated upon the summit and both slopes of the Sierra Nevada, and contains three important towns, which are but cities in embryo. The town of Markleeville is situated on the Middle Fork of the Carson, and about one mile from the main east Carson river. Its location is pleasant, and the climate is certainly very mild. The heat is not oppressive in summer, and the cold is not severe in winter. We have now reached the middle of winter, and the ground is destitute of snow. At an altitude of 7,000 feet, a person would naturally suppose the whole face of the country would be covered with snow for several months in the year, and all communication cut off from the outer world and the "balance of mankind." But such is not the case. Our roads are in a passable condition, and the express and mails are carried regularly between this place and Genoa. Twice this winter has the thermometer been below zero, and twice has our country been covered with snow; but the climate is too mild to allow such a state of affairs to continue for any length of time. Not only is the climate mild, but healthful. I have never lived in a more healthy country. We are blest here with the purest mountain air and water from the eternal snows; and then our mountains are covered with forests of pine, spruce and fir. In addition to all these "creature comforts," no one can compute the value of our mines, for hundreds and thousands of gold and silver-bearing veins thread the mountains; and when capital, will and muscle are brought to bear, we shall astonish the world. Our mines, however, have not yet been sufficiently developed to create any excitement abroad, as it has been but little over one year since this country was only a howling wilderness. Less than twelve months since no freight was taken beyond this place except by pack-trains, whereas now the largest freight teams are enabled to carry supplies to the "regions beyond." During the previous year (1863), there was but little effort made to develop the mines, as most persons who came to this locality were merely agents to locate, and work sufficiently to hold ledges which were supposed to contain the substance of things hoped for," and during the present year hundreds of claims have been lying idle for want of means to push the work ahead. But, in spite of the hard times, some companies have been driving ahead, and are having the best of evidence to cheer them up, and give them courage to prosecute their work. The Morning Star Company, of Great Mogul District, after running a bed-rock tunnel some 800 feet, have reached and gone through a ledge 23 feet in width, which, from a trial by mill process, it is found will work an average of $60 per ton. The Company intend hauling their rock to the Pioneer mill, at this place, and have it worked by the Rivot process. Before the Spring opens we shall be shipping silver bricks, and before that time the Good Hope Company, of Alpine District, will be producing tons of paying ore. This company, after having run a tunnel something over 200 feet, have reached a ledge four feet wide, and are also making preparations to have their rock worked. The Scott Bar Consolidated Tunnel Company have also been driving ahead. This company is running a tunnel into the famous Boulder Hill, which contained gold-bearing boulders all over its surface, and they are expected soon to reach one of the ledges which pass through the hill. A great many other companies have done a large amount of work upon their claims, but owing to the pressure of the times have been compelled to suspend operations until another year. I might speak of several other claims which have flattering prospects, but as my sheet is full, I shall reserve mention of them for another time, and close by bidding you "a happy new year." Sirrom.

Markleeville, December 27, 1864.

At Painesville, Ohio, there is an ossified man whose bones have become limestone. He cannot move a single joint or open his jaws, and is totally blind. Food is placed in his mouth, and nature carries it into his stomach. He lies upon his side, upon a low bed or couch, which serves also as a litter, with his feet drawn up somewhat, and his right hand caught up near his shoulder; lies thus all day long, shifting his position but once in twenty four hours, when he is turned over on the other side. While he is thus completely ossified—a human block of limestone, as it were—his skin retains its normal character and condition, and discharges its functions regularly.

It is a remarkable fact that persons losing themselves in the forest, or in a snow-storm manifest invariably a tendency to turn round towards the left, to the extent even of eventually moving in a circle. The explanation of this is found probably in the fact that the limbs and muscles of the right side are generally better developed than those of the left. Shoemakers say that as a general thing, the right foot is somewhat larger than the left and that the right boot wears out first. Under the excitement felt when one is lost, and in the absence of any guiding line, the superior energy of the right limbs throws the pedestrian insensibly round to the left.

It is said that St. Peter's Church, at Rome, is such an architectural world by itself that it actually has a separate atmosphere, distinct from that of Rome by some ten degrees of heat, and unvarying through the year.

The Problem of Gold and Silver Extraction---A General Review.

BY PROF. L. LANSZWEERT.

This is a subject which at the present time should attract the earnest attention of all classes interested in gold or silver mining pursuits. It is a curious fact that very few people, even in this our golden State, have any clear and distinct knowledge about the true nature of the metal, by the magic power of which all of us have been attracted to this distant shore, which everybody handles, or at least wishes and expects to handle, and which, no doubt, is the principal element, the *soul*—we would almost say the *god*—of this famous country of California and adjoining States. The hardy miner, though perhaps digging for years after the glittering grains, knows little more about the natural properties of the same than that he finds so many *cents'* worth in the bottom of his pan, or, that he clears so many dollars a day, or, that he sells his "*dust*" for so many dollars and cents per ounce. The enterprising trader, in most cases knows hardly more about his gold than that it came from this or that locality; that in consequence, he expects to gain at least his "two bits" per ounce, and that something must be wrong somewhere, if the returns should fall somewhat short of his calculation. Nay, even among the class of our quartz mill owners, which is or ought to be, imbued with a larger amount of general instruction, you will seldom meet a person that has an accurate, substantial knowledge of the natural history of gold. Hence it arises that so many failures about the explorations of gold bearing lodes, and inadequate machinery adopted for the various ways and means for its extraction from its nature may be duly ascribed to this primitive ignorance.

"Early mention is made of gold and silver in sacred history. Thus the river Pison is described as 'encompassing the whole land of Havilah, where there is gold, and the gold of the land is good.' Of Abraham it is stated that 'he was rich in cattle and in silver and gold.' The poem of Job, probably the most ancient writing in the Bible, states, 'surely there is a vein for the silver and a place for the gold where they fine it.' From these passages, it would appear that a knowledge of metallic veins, where gold and silver was obtained, then existed; and it may be inferred also, that what are called in California *placers* was known, for Job states 'that the earth has dust of gold.' After his trial and the restoration of his cattle and other property, the interesting information is afforded that each of his visitors also brought an ear-ring of gold, showing the use of this metal as a personal ornament. Gold being so generally found in a metallic state, together with the fact that, as compared with iron, it can be worked at a much lower temperature if fire is employed, its ductility and extreme beauty, all combined to render it probable that it was the first metal worked by man.

Of the mode of refining gold and silver adopted by the ancients we have only very meagre sketches; the probability is that it was usually done by fire, with the aid of lead. It is possible, however, that the Egyptians knew more than this, for on the linen wrapping which encased a mumay, recently unrolled, the name was found written in indelible ink, which, on analysis, was ascertained to contain silver, similar to the marking ink of the present day. The natural inference is that a knowledge of the use of nitric acid was not unknown to that ancient and extraordinary people. If this supposition is correct, one step more, and that a not very improbable one, namely: the employment of *aqua regia* would enable them to dissolve gold, which would be the only material required for the solution of the golden calf destroyed by Moses.

The preceding facts are merely mentioned as little interesting scraps of ancient history, the probability being that the earliest workers of gold and silver reduced and refined these metals by the aid of primitive furnaces similar to those still employed by the natives of India. The Romans obtained immense amounts of silver from Spain, by subjecting the rich argentiferous galenas of that country to cupelation. This is evidenced by the enormous heaps of litharge and scoria left by them in the vicinity of Carthagena, the revivification of which has of late years been made a profitable speculation.

We have no data to decide the periods when the reduction of gold and silver ores, with their subsequent purification and partition, was produced by other means than the simple action of fire. It is probable that the use of lead or its ores and mercury, as adjuncts to these operations, was adopted synchronously; for mercury was known from the earliest times. Cinnabar was used as a pigment by the ancients; corrosive sublimate was known to the Arabians, and calomel to the alchemists. The use of lead has been known from the earliest times. Its comparatively easy reduction from its most common ore, galena, and its tolerable abundance, make it a matter of little doubt that lead was a metal employed by man at the earliest periods of history."

In these times when a new industry is rising in this country, promising a mightier development of popular welfare than even the gold discoveries, because it causes a more intelligent working of various branches of industry and science, and as a characteristic quality of American spirit not to stop at any reached point, and even at the rising of a new industry, never to be satisfied with the present mode of exploring it; and this may be one of the most prominent causes of America's faster progress, compared with other nations. Certainly, such demand for new improvements is most justified, if the conditions of the new industry were not to correspond with those under which other countries are working."

To quote further the language of a practical writer who wrote some three years since:—

"There is great danger of going to extremes and thereby favoring wild speculation, and obstructing the real development of mineral resources. Truly, if we could believe all we have heard about silver extraction in the last three months, we should say to the thousands of men who have worked in other countries for the same purpose: "Burn all your books, forget all your experience; we, occupying ourselves for a few months with that question, have found things that set aside your centuries of study and experience." How much of such discoveries are due to mere charlatanry it is not our task here to investigate; but it may be useful to take a look to those experimentors, who truly believe that they have made important discoveries. We are told that they extract the silver in as many hours, as days are necessary in the best hitherto established processes, at half the cost of European extraction, although labor costs here ten times what it costs there; at less than half the usual loss of metal, although the ores are richer, etc., etc.

In this way the excitement grows more and more, and the capitalists remain waiting, to see whether the next day will not bring forth more astonishing wonders, that will yield larger profits. Such discoveries originate usually in a want of chemical knowledge, and an ignorance of the experience already acquired in other parts of the world.

In other parts of the world, if a new industry is rising, one looks for men who have studied and managed industry where it already exists. In California there exists other fashions. First, the community is overwhelmed with the fever of speculation and discoveries. The final owners then, don't know how to manage the business, and to go most secure, they like more to give the management to men whose honesty and practical ability they know, rather than to scientific men. They are not always to be blamed therefore, as it may present some difficulties, here in California, to ascertain whether a man, claiming to be a scientific miner, really is such, and if he is, at the same time, a practical business man. I am far from the opinion that there are no improvements to make in silver extraction. The general progress of the world will not be stopped on that single point. On the contrary, it is highly probable that for the particular conditions of the Washoe country a combination of different processes will give better results than any one of the above enumerated. But even therefore it would require, in California, men that are thoroughly acquainted with the economical results of the hitherto used processes and the various trials that have been made in older mining countries. New discoveries are scarcely needed; but a perfect knowledge of the vast material of experiences, to take advantage of them at every given instance.

[To be Continued.]

THE ALPS TUNNEL.—The benefit that the Alps tunnel will bring to France and Italy will be very great. To say nothing of the increased passenger traffic, goods will then be sent from the one country to the other easily and rapidly, avoiding the long and laborious passage of the Mont Cenis as well as unloading and reloading at St. Michel and Susa. When, regardless of snow-storm or avalanche, the train in less than half an hour passes under the Alps, it will indeed be a change from the time when the Carthagenian troops toiled painfully over the chain, and, after winning their way through treacherous foes, perished by snow drift and precipice before they could reach the sunny plains on which they had gazed from the ridges above the plateau of Mt. Cenis.

A SAN FRANCISCO WHALE SHIP.—Charles Hare has purchased the ship *Edward Cary*, which he intends to repair and refit for a cruise after whales in the Northern Pacific.

Chemical Experiments---Assays of Silver and Salt.

Orlando Jennings, an assayer at Austin, Reese River, furnishes the Reese River *Reveille* the following, which is valuable, chiefly, as furnishing the comparative values, for metallurgical uses, of salt obtained from various localities in the Reese River and Humboldt regions:—

The humid or volumetrical assay of silver bullion is now adopted in the mints and assay offices as being correct and expeditious.

It is done by preparing a solution of common salt (chloride of sodium) of a known strength or density, so that a given measure will precipitate a gramme, or ten grains, of pure silver from a nitric solution.

Such is the distinctness of the termination of the chemical reaction and precipitation, that the fineness of a bar of bullion may be determined to the one thousandth part, and closer if it was desirable.

The determination of the strength of chloride of sodium is precisely the converse of the above operation. One hundred parts of pure silver requires fifty-four and one-tenth parts of pure salt to precipitate it from its solution.

Experiment: Weigh .541 gramme of the salt to be tried, and dissolve in about one hundred grammes of pure water; then dissolve one gramme of pure silver in five grammes of nitric acid, and dilute to one hundred cubic centimetres, until the last drop ceases to produce a precipitate, and the number of cubic centimetres remaining, deducted from one hundred, will leave the per cent. of chlorine.

The amount of chlorine contained in any salt determines its value for metallurgical purposes. The article obtained from the different localities and used in this place is found to be of great purity. An average sample from the Smoky Valley Company's warehouse shows .909 per cent. and after drying .95 and .96—choice samples 97 per cent. Sand, and some sulphate of soda was found to be the impurities. A sample obtained from Messrs. Morgan & Muncey's mill, said to be from Sand Springs, was 96 per cent. Dry table salt from Humboldt 99½ per cent. The salt used about here in the mills probably contains five per cent. of water, more or less. If an excess of salt is used in amalgamating, the mercury becomes divided into numerous minute globules, which are reunited with difficulty and are likely to pass off with the sand and occasion loss. When mercury is boiled with water in this state of division, a considerable quantity of the metal passes over with the steam.

HEALTHY BUT WATERY.—The *Oregonian* has been collecting statistics about the old pioneer town of Astoria, from which it appears that, since the year 1814, of the whole number of deaths there, ninety per cent. were caused by drowning. Astoria is so situated that all travel to or from the town in every direction is done by water—generally in small open Chinook boats, and often when the bay is nearly as rough as the ocean. That accounts for the drownings.

BROKERS' CONTRACTS MUST BE IN WRITING.—The suit of Henry Toomey vs. Richard Ivers, recently tried in the Fourth District Court, resulted in a finding for for the defendent—Judge Sawyer deciding that the "buyer 30," broker's contract, on which the suit was predicated, was not binding, because there was no written memorandum of it made by the parties.

An engineer on the Cleveland, Columbus and Cincinnati Railroad, recently protested against starting his locomotive from Cleveland on the 7th because it was unsafe. The order was imperative to start, however, and the locomotive exploded at Shelby Junction, killing the engineer and scalding two others.

No important invention ever spread so rapidly as the sewing machine. It was first patented by Elias Howe in 1846, and now nearly one hundred thousand are annually manufactured in the United States alone.

A practical furrier says:—"The best way to keep moths from furs when putting them away in the spring is to heat them and comb them; it is better than pepper, snuff, tobacco, or anything of the kind."

At the agricultural competition of Vaucluse, in France, held at Thor, last summer, the prize for plowing was carried off by a young woman twenty years of age.

THE English Earl of Malmesbury thinks that when the American war is over the people of England can buy wheat in this country cheaper than to raise it in their own.

THE coal fields of Pennsylvania have yielded, on an average, two hundred and thirty thousand tons of coal per week for the last three months.

The Extraction of Gold and Silves from their Ores.

It is not to be denied that since the discovery of gold in this State, the science of Metallurgy has received an immense impetus. New processes without number have been introduced for the extraction of gold and silver, which have been tried, and in all but a very few cases abandoned. But still how crude and imperfect are the best of processes at present employed. It is speaking quite within the limits of general experience, to say that not more than three-fourths of all the gold and silver are extracted by the best process at present employed. When it is remembered that the annual product of the precious metals on this coast exceed fifty millions of dollars per annum, an idea of the value of the quantity lost may be formed.

WHAT IS WANTED.

In quartz mining for gold, the *desideratum* appears to be some agent that will force the imperceptibly fine particles of pulverized gold into contact with the mercury, without separating the mercury into such minute particles that it floats away with the tailings. It is a demonstrated fact that grinding mercury, or stamping it too much, causes an immense loss of itself, and the metal it is employed to collect. This fact any mill man may prove for himself, by placing a pan at the end of the troughs used for carrying off his tailings. It matters not how long these troughs are, how much mercurial surface, or how many riffles, hides, blankets or gunny-bags, they contain, in less than an hour, if he washes out the sedimentary matter in the pan, carefully, before it shall be half accomplished he will find on the edge of the particles of sand, a white fringe, which if he rubs with his finger will be speedily transformed into globules of the mercury. This experiment we have tested in a thousand cases with one invariable result. Here is the greatest cause of loss in quartz mining.

LOSS IN PLACER MINING.

In placer mining where it is true gold cannot be said to exist as an ore, a still greater loss is experienced through not bringing the gold in contact with mercury. Much of the gold in all the alluvial deposits exists in such minute specks that though gold is nineteen times as heavy as water, these specks are so minute that they will float on the surface of water. Every miner is well aware that fine specks of gold float. Whoever will examine a quantity of gold as it is obtained from the placer diggings, will observe that it is nearly always in rounded, more or less smoothened grains. Now every one knows that gold, when taken from the quartz, is always rough, with minute particles stickiag out all over the grains, like "the quills on the fretful porcupine." These little particles are never recovered in the soil washed for gold. They exist, for gold is indestructable.

WHAT BECOMES OF THEM—INTERESTING EXPERIMENT.

As a proof of what becomes of these particles, during an entire summer we made experiments on the dirty water that ran through a flume in Tuolumne county, and when the miners in the large hydraulic claims were working, by evaporating a gallon of this dirty water we could at any time obtain from one to ten cents worth of gold in the sedimentary matter. If some cheap process could be introduced for working the "slum," as it is termed, that accumulates in the vicinity of rich placer diggings, fortunes could be realized by the operation. As this is a matter of vital importance to the people of this county, we intend to write a series of articles on the subject, which we shall endeavor to make as interesting as possible. This is merely to call attention to the matter. —*Grass Valley Union.*

As Mr. Bennett, the writer of the above, is a gentleman of highly scientific qualifications, and has had many years of close, practical observation in mining, we shall look with interest for his promised continuation of the above mentioned subject.—[EDS. PRESS.

COCHINEAL IN NEVADA.—Mr. W. M. Gabb, paleontologist of the State Geological Survey, at a late meeting of the California Academy of Sciences, read a paper on some cochineal insects found on a cactus plant, in Humboldt County, Nevada. They are, perhaps, not specifically the same as the Mexican cochineal, but they are very similar in external appearance and internal color. In some places, it is reported, that these insects are very abundant. The value of cochineal has, however, decreased greatly since the discovery of the aniline carmine, which is permanent and as brilliant as that made from the insect, and can be produced in any quantity from common soot.

TOO LARGE.—The territory of Idaho is too large, so the people of that territory seem to think, and accordingly the Territorial Council propose to present a memorial to Congress asking that it be divided.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, JAN. 7, 1865.

No important variations have occurred in the market for first-class shares, which have, for the most part, been well maintained. Flattering developments continue to be made in a number of claims on the Comstock, and the future productiveness of these mines is well assured, for some months to come at least.

The condition of the roads in Nevada has materially improved, and little or no difficulty is now experienced in supplying the mills with ore.

Transactions in the Board this week in low-priced stocks have been rather lighter than usual. Most of these shares are dealt in without much regard to their intrinsic merit.

The aggregate recorded sales of stocks at the Stock and Exchange Board during the year 1864 amounted to $36,985,650. The smallest weekly sales amounted to $82,000, and the highest to $1,034,000,-the average being about $700,000 per week.

The money market is easier, and some amelioration may be noted in the rates of interest. Loans can be readily negotiated upon good mining stocks; with a fair margin from current market value, at 1½ ₱ cent. per month, and we learn of transactions at 1¼ ₱ cent. Receipts of treasure from the interior have amounted to some $1,000,000, chiefly in gold and silver bullion. Bullion is abundant, and without special inquiry from shippers since steamer-day. Gold bars may be quoted at 800@810. Silver is selling at ½ ₱ cent. premium to 2 ₱ cent. discount.

Legal Tender Notes have been dealt in to the extent of $89,000, declining from 46¾ to 45½, and closing at 46. Latest telegraphic advices from the East quote gold in New York at 230 on the 6th inst.

California Steam Navigation advanced to 80 ($800 per share), and is now inquired for at 78. State Telegraph is lower, and offered at $33 per share. Spring Valley Water Co. fell from 80 to 75 ₱ cent. on amount paid in, and San Francisco City Water Co. declined to 75 asked. The consolidation of these two companies will be legally effected in a few days. North Beach and Mission Railroad is held at 105. A dividend is anticipated at an early day.

Savage has been moderately dealt, advancing from $1,600 to $1,660, buyer 30, receding to $1,625. New deposits of good ore continue to be found in various portions of this mine, and the product for January will probably exceed that of last month. It is said that ample ore is now disclosed to warrant the present yield for twelve months hence.

Gould & Curry opened at $1,580 rose to $1,590, declined to $1,550, and then sold for $1,465, ex-dividend of $75 per foot paid on the 5th inst., and closed at about $1,465. We can learn of no new feature in this mine. The yield of bullion is fully up to the usual average.

Chollar has been very active and 43 feet were sold, advancing from $1,050, buyer 30, to $1,080, buyer 30, receding to $1,020, cash, rallying to $1,050, and selling yesterday at $1,030. This company have declared their first dividend—$40 per foot—payable on Tuesday next. The prospects of the company are believed to be such as to warrant regular monthly dividends hereafter. From the 5th level, in the north mine, good ore is now hoisted, and the south lode continues to increase in length and width. Shipments of bullion this week amount to $46,000.

Yellow Jacket was more active than usual, and 20 shares were sold, steadily advancing from $750 to $810 and closing at $785. The yield of this mine for the month of December amounted to $93,000, and the product for the current month is likely to be considerably increased. The liabilities of the company are being rapidly curtailed.

Belcher met with a single transaction at $800 per foot and is now held at $800. This company paid a dividend of $24 per foot on the 5th inst., and are in a more promising condition than for several months past.

Potosi is in rather less request and is offered at $675. The trial of this company's suit against the Bajazet has been again postponed, and an order was granted for a commission to issue, to take testimony.

Empire Mill & Mining Company is dull and inactive at $525 asked. A dividend of $20 per share is payable to-day out of the earnings of the past month. The affairs of this company are thought to be more flattering.

Uncle Sam is in better favor and 27 shares have been sold, advancing from $180 to $200. At the close the latter figure was bid.

Hale & Norcross has not materially changed and 14 feet were dealt in at from $250 to $260 closing at $250.

Ophir has been very active, and 96 feet have changed hands, receding from $375 to $285, rallying to $300@$315, buyer 30, and selling yesterday at $290@$300. A prominent stockholder has been a large seller during the week.

Imperial has attracted more attention and is now in favor at enhanced rates. 110 shares were sold, steadily advancing from $108 cash, to $125, buyer 30. The entire yield of this mine for the month of December amounted to $52,000, and a surplus $12,000 was taken to the dividend account. The resumption of dividends is confidently looked for at an early day.

Overman was sold yesterday at $100 per share. Crown Point was offered at $725.

Bullion has been active, at fluctuating rates, advancing from $118 to $130, buyer 30, receding to $115, rallying to $121, buyer 10, declining yesterday morning to $105, and closing at $112. 896 shares were sold within this range.

Burning Moscow has been comparatively steady, advancing from $27 to $30, and receding to about $22. Between these figures, 2,500 shares were sold.

Bajazet & Golden Era is in better favor, and 220 shares were sold, steadily advancing from $17½ to $27.

Nevada (J. G.) fell from $32 to $28, rose to $47½, receded yesterday morning to $40, and closes at $41. 252 shares changed hands at these rates.

Real del Monte was sold at $18—the first sale recorded for a long time. Judge Sawyer, of the Fourth District Court, has granted the injunction asked for by J. J. Robbins against this Company, and the decision has called forth a good deal of comment in stock circles.

Buckeye declined from $4½ to $2½; Sierra Nevada fell from $15 to $10; De Soto was sold at $4, and Lady Bryan at $7.

The total sales for the week amount to $424,846.

— FOR THE —

Mining and Scientific Press,

— THE MOST —

Profitable Newspaper

— FOR THE —

Readers of the Pacific Coast.

Tenth Volume—Jan. 7, 1865.

DEWEY & CO., Publishers.

Our Journal enters its TENTH VOLUME with marked prosperity and improved facilities and resources for furnishing a handsome, valuable and well filled sheet.

Its size is equal to that of Harper's Weekly, and its columns, upon comparison, will be found to contain a larger amount of reading.

We believe that the PRESS furnishes more information of ready application and intrinsic value to its readers than any other journal on this side of the Continent. Its circulation has doubled during the past year, and, for the economy and interests of the industrial classes of this and neighboring States, its subscription list should be more than trebled for the ensuing twelve months.

We shall continue to make the MINING AND SCIENTIFI PRESS substantially

An Instructor to Prospectors,
An Economist to Millmen,
An Assistant to Active Miners,

An Economizer for Mining Advertisers,
A Reliable Reporter for Shareholders.
A Faithful Monitor for Stockdealers,

An Intelligencer for Mechanics,
An Incentive to Inventors,
A Reflector for Patentees,

And a Helpmeet to all Industrial Classes

Upon the Pacific Coast. We shall give accurate and frequent

FOR SENDING ABROAD.

As a paper for mailing regularly to your friends in the East or to correspondents elsewhere, none can be selected more appropriate, or better calculated to dispense reliable information with regard to transpiring events on this coast and the progress of California.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

SUBSCRIPTION IN ADVANCE.

Authorized Scale of Commissions Adopted by the S. F. Stock and Exchange Board.

Miscellaneous.

Funded Debt, on par	½ per cent
Insurance Stocks, on par	½ per cent
Wharf Stocks, on par	½ per cent
Gas Stocks, on par	½ per cent
Railroad Stocks, on par	½ per cent
Steamboat Co. Stocks, on par	½ per cent
Telegraph Co. Stocks, on par	½ per cent
Water Co. Stocks, on par	½ per cent
Legal Tender Notes and Bonds, on par	½ per cent
Bills of Exchange, on net amount	½ per cent
Mint Certificates, on net amount	½ per cent
Specie, on net amount	½ per cent

Commissions on Mining Shares.

Sale at 1 dollar up to 10 dollars	$0 25 per foot
Sale at 10 dollars up to 25 dollars	50 per foot
Sale at 25 dollars up to 50 dollars	1 00 per foot
Sale at 50 dollars up to 100 dollars	1 50 per foot
Sale at 100 dollars up to 200 dollars	2 50 per foot
Sale at 200 dollars up to 400 dollars	5 00 per foot
Sale at 400 dollars up to 600 dollars	6 00 per foot
Sale at 600 dollars up to 800 dollars	7 50 per foot

From $800 to $3,000 per foot, one per cent, on the amount of purchase or sale.

Anything above $3,000 per foot, three-quarters of one per cent. on the amount of purchase or sale.

FRANK LAWTON, Secretary.

J. E. E. CAVALLIER President

Mechanical.

NEW HYDRAULIC PIPE—IMPORTANT TO HYDRAULIC MINERS.

Some twelve months since we made a brief allusion to a recent invention of Messrs. Macy & Martin, of Red Dog, Nevada county, the object of which was to obviate the difficulty experienced in hydraulic mining of the windage, which is always noticed in the discharge from a hydraulic pipe. These pipes have now been used about two years in the neighborhood where they were invented (Red Dog and Little York, in this State), and are spoken of by all who have used them as greatly superior to pipes of the old construction. The hinderance to their general introduction has arisen chiefly from the difficulty of securing them at a price within reasonable bounds. This objection has, however, been overcome, at the Miners' Foundry, in this city, where accurately constructed patterns have been made, from which castings are prepared at a rate of cost less than by the ordinary manner of constructing these pipes. The whole State may now be supplied with this improved implement—one of the most important used in that extensive and increasing branch of mining.

The new feature in these pipes consists of three "ribs," or, as they are called by the miners, "rifles," in reference to the rifles in a gun-barrel. Why they should call them rifles is more than we can imagine, for they are in every respect the exact opposite, and for an exactly opposite purpose to the rifles in a fire-arm. Instead of being spiral *grooves* cut into the barrel for the purpose of giving the discharged projectile a rotary motion, these contrivances are raised *ribs*, or thin plates, running perfectly parallel with the pipe from butt to nozzle, for the purpose of counteracting the tendency of the water to twirl or rotate as it passes through the pipe, thereby causing the stream to break and scatter after leaving the nozzle, and so lose much of its force and efficiency for doing work. In addition to the guide-plates in the pipe, the body of the pipes and nozzles are proportioned and tapered with mathematical exactness, with regard to the known laws of hydraulics, governing a jet of water when forced through a nozzle under very high head or pressure, as is now frequently used in hydraulic mining. The nozzles are of chilled iron, which will make them more durable than when made of softer material. We should be pleased to hear further from those using this pipe, as we deem it a matter of much importance to the mining community.

An English Drilling Machine.—Late English papers describe a new machine for drilling holes in rock, by the application of power instead of by manual labor. The inventor is a Mr. Westmacott, a partner of Sir William Armstrong. The inventor has taken for his model the operations of a man in drilling, the various movements being exactly copied. First, the drill is pressed against the stone to be operated on, and then a blow is struck; the drill is then withdrawn, turned a little, and again pressed against the stone and struck. All these operations are performed by the machine itself, which is said to strike from 150 to 200 blows per minute. The machine is represented as capable of performing the work of twelve men. The above is no doubt all correct; at least it is extremely probable that it is so, from the fact that on the 30th of January last we published a full and illustrated description of a machine answering almost precisely that given above, and patented by Mr. J. S. French, of this city.

Flax vs. Cotton.—The Stark Mills, at Manchester, N. H., have had their cotton machinery so changed as to spin and weave flax. Before the war, these mills turned out about 100,000 seamless cotton sacks per month. They have now commenced the manufacture of flax, and expect to turn out 16,000 yards of linen per day. Linen will soon become an important article of manufacture in America. American ingenuity will prove more than a match for the low price of European labor in this branch of industry.

Hough's Balloon Windmill.—One of these ingenious and most effective windmills has been in constant operation at Martinez for the past four months. This mill is constructed on an entirely new principle, the fans of the mill being constructed and placed exactly like the floats of a stream water-wheel. It has a self-regulating arrangement, by which the driving power is always kept at a fixed grade. It also has a self-conducting arrangement, by which, when the wind is light, the breeze may be readily collected and thrown upon the wheel. This conducting arrangement, when the wind is heavy, is, by a simple contrivance, made to so cover and protect the wheel that it may be kept running during the heaviest wind. To show its efficiency, we may state that the mill at Martinez has been kept running during all the severe northern gales, when all other windmills in the neighborhood had to be secured to prevent their destruction. The mill above alluded to is said to have raised a three-inch stream of water 22 feet, force it through 400 feet of hose, and send it 75 feet from the nozzle at the end of the hose. These mills are manufactured and sold by Dr. E. F. Hough, of Martinez, who also sells rights to make the same. They can be made by any carpenter.

Machine for Cutting Coal or Stone from Mines.—Mr. James Grafton Jones, of London, has patented a pick, worked by compressed air, to cut into masses of coal, stone, or other mineral. A cylinder like a steam cylinder is mounted on a carriage. Its piston-rod is a trunk, of such size as to give a weak return-stroke. The connecting-rod is jointed to a button, that revolves in a button. The pick shaft is in bearings, that revolve around a center coincident with the center of the cylinder. An arm on the pick-shaft is worked by the piston-rod. By means of a hand wheel the operator causes the pick-shaft to revolve, so as to cut a circular channel; and by another hand-wheel he causes the carriage to advance. The compressed air is supplied through a flexible hose, from the outside of the mine; the power to compress it being steam, as is usual when compressed air is used for mining. The London *Examiner*, of Oct. 28th, has a full description of the machine, with an engraving.

The above machine will doubtless be found to work very well in coal seams, but we doubt whether it can ever be made of any practical value for running tunnels or drifts in hard rock.

The Magneto-Electric Machine.—In philosophical apparatus the magneto-electric principle has been applied with marked success. By the motive power of a small magneto-electric machine, occupying less than a cubic foot, dial or index telegraph can be operated from five to two hundred miles, or further, and with this advantage, that any one who can read may act as operator without special training. Another application is a new ignition for blasting with gunpowder by magneto-electricity. Former machines required large and costly galvanic batteries to ignite the fine platinum wire by which the charge was fired; but the new machine will fire powder at a distance of a hundred miles, or under water by proper precautions, by so simple a means that, as the commissioners say, "electricians will wonder as much as the uninitiated, if not more. It is done by a *pencil mark*. The stroke of a common blacklead pencil on a block of wood is substituted for the platinum wire, and this disintegrated conductor, as it may be called, is so intensely ignited by the magneto-electric current as to set fire to the wood."

Feeding Boilers.—Mr. E. V. Parod has patented (in England) the employment of a jet of water under pressure in such a manner as to induce along with the jet a current of steam, which is condensed, heating the water; and, "as the jet of water possesses a high velocity and considerable momentum, it is proposed to utilize its momentum by causing it, in company with the condensed steam, to penetrate into the boiler." We doubt it; but our want of faith must not always prevent our giving currency to novelties.

Air-tight Ships.—Admiral Belcher, before the British Association, suggested that the decks of ships might be made air-tight, and air-pumps provided, so that in case of a hole being torn in the bottom the air might be maintained at a pressure sufficient to prevent leakage inward, and to force out water that had entered.

Iron Rust.—An English paper says:—"Rust eats fast into wrought-iron structures. This year no less than 40 tons of iron rust were taken out of the Menai tubular bridge at one thorough cleaning." At that rate it will soon be carried away in old iron.

The Iron Trade of the World.

Nothing, says the London *Mining Journal*, has so much contributed to the comfort and civilization of our race as the development of the various industries and extended enterprises which owe their existence to an abundant supply of iron. Perhaps the most striking development of material progress during the last thirty-five years is the introduction of the railroad system. During that period there have been constructed 113,000 miles of railway in the world; and this appears to us as the mere prelude to the extension of this enterprise on a scale so vast as scarcely any living man can conceive. There has been expended on these 113,000 miles of railways already constructed upwards of 400,000,000 tons of iron.

Great Britain and France control the world; and, fortunately for the happiness of mankind, they seem to have elected in favor of peace; and their enormous resources, which might otherwise have been dissipated in war, will unquestionably be diverted to that other great enterprise, which we regard as having merely commenced—the construction of railways, which, proceeding at an increasing ratio, will only be retarded by the supply of iron that can be furnished by the mines of the world. The immensely increased demand for ships and steamers built of iron will also of itself form a large drain upon our production of this mineral.

There are now about 350,000 tons of iron in warehouse-keeper's stores in Scotland, which is the only reliable reserve for a trade embracing 4,000,000 tons per annum. The shipments of pig iron from Scotland this year have been 401,000 tons, showing an increase of 26,649 tons over the corresponding period of last year; and the foundries and malleable iron works in this district have been so actively employed as to give rise to a consumption of about 12,000 tons weekly.

It is rather a striking occurrence that recently upwards of thirty-five furnaces have been put out of blast in Staffordshire, although the price of pig iron has ruled in that district from 70s to 75s per ton. Nineteen years ago the price of Scotch pig iron attained 120s per ton, and for many months afterwards it was maintained at above 100s per ton. In 1854 the highest price was 92s 6d, and the average price for that year was 80s per ton.

It may be noted as a singular feature in connection with the iron trade, that the highest range of prices for iron seems to be co-incident with high rates of money.

Dyeing.—The discovery of the art of dyeing is attributed to the people of Tyre, and the Tyrian purple, the most ancient dye on record, was an animal juice produced from a shell-fish found on the coast of Tyre. The Greeks and Romans paid but little attention to this art. The Jews, in the Middle Ages, were the principal people who carried on the business of dyeing, and by them it was introduced into Italy and other parts of Europe. For many ages the art of dyeing was almost unknown in England; the practice was merely to plunge the cloth into colored liquid, without any previous chemical process for fixing the dye. A large portion of English manufactures were sent white to Holland, and returned dyed for sale. The art of dyeing woolens was brought from the Low Countries in 1607; but so slow was the progress made that it was not till the year 1780 that the changes produced were understood to be dependent on chemical affinities.

Prussian International Exhibition in 1865.—On the 15th day of May, 1865, a general "exhibition of industry" is to be given in Stetin, Prussia, to which all nations are invited to contribute. A small charge will be made for the space occupied by each product. The exhibition will continue during May and June. At the close of the exhibition there will be a distribution of prizes, the manner of which will be subsequently fixed and made known. Application has already been made to the Prussian Government for permission to dispose of the exhibited articles by way of a lottery. Here is another opportunity for our inventors to exhibit their labor-saving machinery. The last exhibition at Hamburg brought a great many American inventions into general notice and use in Germany, particularly the agricultural improvements, which the Germans value very highly.

A "Smashing" Mill.—We are informed that Morgan's new quartz crushing mill, located on Carson river, below the State Reduction Works, at Empire City, Nevada, is soon to go into operation. Twenty-two of Hepburn & Peterson's amalgamating and reducing pans are already set up. The machinery will be run by one of the largest size Jouval water-wheels, recently manufactured at the Vulcan Iron Works, in this city.

A Smokeless Furnace.—There is in operation at the engineering works of Messrs. Moreland, London, a furnace patented by Mr. E. B. Wilson, which is said to economize fuel to a considerable extent, and which may be rendered almost smokeless. This furnace, which is used for heating rivet bars, has no fire-bars. It consists of a chamber or box at the back, to contain the fuel, and a reverberating oven connected therewith, the fire being at the other end of the oven, and connected with the ordinary chimney-stack. The coals are ignited in the box, to which they are supplied about twice a day. As there are no fire-bars in the furnace, the air enters upon the surface of the fresh coal in the box, causing a downward draft, as the floor of the reverberating oven slants downward from the coal box. The gas is thus slowly and continually distilled until it comes in contact with the lower stratum of burning coals, when it receives its proper dose of calorific, and passes into the reverberating oven, heating any material that may be placed there, and passes downwards by the flue which descends at a point a little inwards from the mouth of the oven.

The principle adopted seems to be that of turning a common fire upside down, not unlike "the *Builder's* Fire," or a furnace back foremost, so that the fresh coal is applied at that end whence the smoke of its first ignition goes through the fire and is consumed, instead of being placed on the end of the fire, whence the direction of the draft carries it off as soon as evolved. The principle is very simple, and probably efficient, though not novel.

Gun Cotton.—Trials are still going on with gun cotton, and if its deterioration can be prevented there can be little doubt that it will prove a most valuable addition to, if not a substitute for, gunpowder. We have already recorded its power in the destruction of an Armstrong 110-pounder, when used in a shell, and we may hence judge that the armor plates, which are little affected by the explosion of powder shells, will be cut in two by shells filled with gun cotton. It is true that gunpowder deteriorates both from damp and motion, but not in so great a degree from exposure to the atmosphere as gun cotton. On the other hand, gun cotton may be carried wet in tanks in perfect security, and possesses, both in power and extreme lightness and cost, and in not fouling the guns, very great advantages over gunpowder.—*Army and Navy Gazette (England)*.

Lighting Gas by Electricity.—At the British Association meeting, Prof. W. B. Rogers exhibited an invention by Mr. Cornelius, of Philadelphia, for lighting gas by electricity. It was the first time it had been exhibited in Europe. The electrical apparatus was attached to a common gas-burner. It was an application of the principle of frictional electricity, and, as soon as the Professor removed the stopper of vulcanite, the friction generated an electric charge, and the gas was instantly ignited. It could be made so as at the same instant to light the whole of the burners in a room.

A miniature telegraph office, designed for a present to the Emperor of Russia, has been prepared by an artisan of New York city. It consists of a complete telegraphic apparatus, capable of transmitting messages between New York and Boston, all embraced within the compass of a morocco case eight inches in length, six inches in width, and three and a half inches in depth.

Eastern Treasure Shipments.—The tide of treasure shipment seems to be turning in our favor again, and Bankers are inclining to the opinion that it is more profitable to ship their Gold Bullion to New York, than to export it to England as has been the case heretofore. For nearly a twelve month our shipments to England have been nearly double those to New York.

An Appropriate Present.—A maul and set of wedges are to be manufactured from some of that cord of Washoe mahogany at Silver City, finished off with bands of Washoe bullion, and forwarded as a present to Abraham Lincoln, the rail-splitter President.

A large telescope is being manufactured at Springfield, Mass., the tube of which, a splendid piece of mahogany, was formerly one of the pillars to the pulpit in the old church at Northampton, Mass.

No printed matter is sent overland except at letter postage, but each steamer carries from 46 to 59 bags. The average number of letters sent by steamer and overland is about 60,000 per month.

Water Companies to Consolidate.—It is stated that the San Francisco Water Company and Spring Valley Water Company are about to consolidate.

Coal, in large quantities, is daily landed at Stockton. It is extracted from Mount Diablo.

It is Impossible for editors to know all the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventions can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:
Saturday Morning, Jan. 7, 1865.

NEW METHOD OF TREATING AURIFEROUS AND ARGENTIFEROUS ROCK.—Every one who has had any experience in quartz mining is aware of the difficulty of separating thoroughly the alloys of gold and silver combined in what is known as refractory ores, when worked by the "wet process." The London *Smelting Magazine* suggests that the difficulty may be entirely obviated by a process now proposed, which is to roast and lixiviate the ore with a solution of concentrated common salt, saturated with chlorine, when both metals will be simultaneously precipitated.

The above item, which we clip from the *Alta* of Sunday, refers to a chlorination process described by Dr. Grace Calvert, in a paper recently prepared by that eminent chemist and metallurgist, and read before the "British Association for the Advancement of Science." The paper was prepared with especial reference to the fact that the British public was at this time becoming especially interested in the working of gold ores within the island of Great Britain. On page 393 of the MINING AND SCIENTIFIC PRESS, of December 17, 1864, we gave quite a full description of this process, with editorial comments, going to show that the process presented no new principle which will be likely to become of any importance to the mining interest of this coast. Gold has long been successfully extracted in California by the chlorine process, and it has been more recently introduced, and, we believe, with equal success, at Pike's Peak. Any person having any curiosity or interest in this direction will find the matter fully described as above.

THE Crescent Quartz Mining Company has declared another dividend of fifty dollars per share, which was made payable on Thursday last. This company recently put up a large steam engine, of 30-horse power, which they use in hoisting the quartz from their ledge. Since the completion of the hoisting works there is probably not a quartz mill in the State that is any better arranged, or has better works throughout, than the Crescent. The company recently cleaned up over $4,000 after a five days' run. The workmen connected with this company's mill and mine have organized a Soldiers' Aid Society, and have expressed the patriotic determination to forward to the Parent Institute a monthly subscription of $50.

SQUARZA, the inventor of scientific potables, and a gentlemen who fully appreciates the benefits of advertising, sent a generous supply of his fluids to the office, with happy greetings for the New Year. Squarza is a man of genius as well as of taste. He has the acknowledgements of the office for his kindly remembrance.

BLUEJAYS are now killed and brought to the San Francisco market and sold for their wings, only, which are used for ornamenting hats for children, young misses, and those who desire to be credited with a few less years than they are really entitled to.

THE BULLION CROP OF 1864.

There was received, during the year 1864, at San Francisco, from the mines of this State, from Oregon and Victoria, from Washoe and Mexico, the sum of $54,047,238. The amount of treasure shipped from the State during the same period was.....$55,707,201
Total shipped in 1863..... 46,071,920

Excess this year.....$ 9,635,281

THE WASHOE YIELD.

We have not yet seen any full statement of the bullion yield of Washoe. By the annual report of the three principal mines of that region, the Gould & Curry, the Ophir and the Empire Mill & Mining Company, we find the yield of these three mines only, reaches within a small fraction of $7,000,000 ($6,954,085.) To this amount must be added the product of the Mexican, the Savage, the Potosi, the Chollar, the Moscow, the Bajazet and other mines in Virginia district—of the Imperial, the Plato, the Burke & Hamilton, the Sandy Bowers, the Crown Point, the Belcher, the Yellow Jacket, the Overman, the Uncle Sam and numerous other claims in Gold Hill district—and of the Dancy, the Pride of the West, and several other mines, more or less productive, in Devil's Gate District. The Gold Hill mines have poured forth a steady stream of treasure—in volume probably as large as Virginia district—while the Savage, the Mexican, the Potosi and the Chollar have each produced more bullion during the past year than the Ophir.

The *Enterprise* says that about $10,000,000 in bullion has been shipped by the Virginia office, of Wells, Fargo & Co., alone, during the past year. That paper further estimates that fully $15,000,000 additional has been sent forward from Gold Hill, Silver City, Dayton, Carson, Reese River, Esmeralda and Humboldt? The entire gold and silver product of Nevada during the past year, which would give a total aggregate of not less than $25,000,000, for the mines of Nevada.

The figures given by the *Enterprise* appear, upon their face, to be well founded; still we are inclined to doubt their correctness, to the extent of at least five, probably seven millions. The books of Wells, Fargo & Co., at Virginia City and Gold Hill, would settle the matter quite conclusively. The item if it could be obtained, would be of much interest to the public.

QUICK WORK.—The workmen on the night-shift in the Chollar mine, at Virginia City, set out, on Saturday last, to see how much ore they could raise in the shift of ten hours time. They raised 230 tons of pay ore, timbering up the ground, from which the ore was taken, in first-rate style. The next day shift went to work with the intention, if possible, to beat this effort. They raised 285 tons in 570 car lodes—being 55 tons more than was raised in the same time by the night shift, and within 25 car loads of what it is possible for the machinery to hoist. The distance from which the ore was brought on cars below was in each case 400 feet; the distance it was hoisted through the shaft 435 feet, and the distance from the mouth of the shaft 40 feet; making the whole distance each car load was moved 875 feet. During a good portion of the afternoon one car load per minute was hoisted. This is believed to have been the best work of the kind ever done on the Pacific coast. Best of all, not a single accident occurred during the whole time this rapid work was being done. All the ground was properly secured with timbers put up in as good shape as though no unusual work was being done. In each case 49 men were employed—44 working below and five upon the surface.

MINING IN ARIZONA.—Private letters from Arizona give flattering accounts of the developments of various mines since work commenced. There have been heavy rains along the Colorado. Several tons of beautiful ore from the Esmeralda Ledge, in Weaver District, near Olive City, has also been shipped for this city.

ACCORDING to the *Pacific*, the valuation of the Protestant Churches in San Francisco is $327,320; of the Roman Catholic Churches, $592,075, including the Colleges.

APPLETON has in course of publication a life of Ericsson, the inventor.

A RICH QUARTZ STRIKE.

According to the Placer *Herald*, Messrs. Lowry & Mitchel, two "strapped" miners from Reese River, while prospecting, week before last, for surface diggings, on Quartz Prairie, three and a half miles north of Auburn, near the Nevada road, struck upon some rotten quartz and earth that was rich with gold. Stimulated by the discovery they continued their labor, and throughout Friday and Saturday took out rock and dirt from a cut, but two feet wide and five or six feet in length, of the estimated value of $3,000. Up to Thursday evening rock had been taken out estimated to be worth $6,000, with the vein showing the same rich indications.

The discovery naturally created a good deal of excitement and visitors flocked to the locality from all the surrounding country. One interest was sold for $1,300 on the second day after the discovery. Extensions of the original discovery have been taken up, in the hope that the good thing is not all confined to one spot. Quartz Prairie is a locality well known to the miners of that section. It is high and rolling, the soil being completely mixed with small particles of quartz, supposed to have been worn and scattered from a prominent vein that runs through the prairie from north to south. At the northern end, upon a small hill, there is a heavy chimney of quartz, and in this vicinity the rich vein of quartz above spoken of was found.

The above discovery affords another evidence of the almost illimitable extent of the mineral resources of California, yet to be developed, inasmuch as it has been made in the immediate vicinity of one of the earliest placers ever worked in this State—near the head of Auburn Ravine, a locality which has been famous since 1849. The discovery will undoubtedly give a new impetus to mining, especially quartz mining in that vicinity. The immense amount of gold that has been taken out of Auburn Ravine, and its peculiar character, renders it almost a matter of certainty that valuable quartz mines must certainly be developed near by. All that is wanted is thorough work, and deep, such as has recently given such a renewed impetus to mining in Grass Valley and elsewhere, where similar enterprise has been developed.

To the Nevada Legislature.

We wish to call the attention of the present session of Legislators in Nevada to a very important subject—viz: the passage of a simple law requiring sworn statements and public reports to be made by superintendents and secretaries of all *important* mining companies in operation in that State, either monthly or quarterly. Also, the adoption of stringent acts for punishment for false reports and other swindling acts in mining transactions. The publication of reports thus guarded will furnish the community at large with reliable information and hints which would otherwise be lost. It would engender confidence, attract capital, and add prosperity throughout the length and breadth of Nevada, to an extent greater than would naturally be apprehended at a first glance of this highly important matter.

A NEW PROCESS.—The Reese River *Reveille* has been advertising a "New Process" for the last two months, to make delinquent mining secretaries "come down" with the dust in payment for their mining advertisements. The "process" has finally developed itself in the publication of a long list of delinquents under a runaway slave cut, accompanied with a "continuation" under a "humped" cat "terribly bristling," and a promise that "other additions" will be made, "as circumstances may seem to warrant." The "process" is certainly new if not effective, and may become generally adopted, as we believe there is no patent for it.

IT is said that 300,000 stand of arms and a lot of rifled cannon have been shipped from England, the past year, to Japan, invoiced "hardware." English soldiers will doubtless, ere long, be called upon to take these very muskets and cannon from the Japanese in arms.

HOT WATER IN MINES.

It would seem to be the fate of the Ophir Company to be more plagued with water than any other company in our mines. They had just succeeded in pumping out the last great influx, and had begun drifting again, when, night before last, another huge subterranean reservoir was tapped. It was struck at a light of about 25 feet above the shaft, and rushed in in such volumes that it was with difficulty that the workmen were able to escape being overwhelmed and drowned. The water had risen yesterday morning to the hight of 160 feet. What is most singular is the fact that the water is so hot that to hold one's hand in it is painful. The rush of water was doubtless from a "pocket," and, we presume, will shortly be exhausted by a diligent use of the pumps.—*Virginia City Enterprise. Dec. 27th.*

The influx and continued presence of hot water in mines is no new thing For a full quarter of a century, thermal or warm water has been noticed in many of the mines in Cornwall, England. The parish of Gwennap, in the neighborhood of Redruth, is, perhaps, the most remarkable in England, if not in the world, for the high temperature of the water in its mines. In some of these mines a most remarkable and regular increase in the temperature of the waters has been noticed within the past few years. This is particularly the case in what is known as the United Mines. At a depth of 1,510 feet, the water, in 1855, indicated a temperature of 118 degrees, Fahr.; eight years afterwards (in 1863) the work had progressed 180 feet deeper, at which point the water indicated an increase of eight degrees in temperature, or one degree in 22½ feet. In the Poldice mine, in the same district, the increase of temperature during the same time was one degree in each 16 feet of descent. The same uniform degree of increase would bring the workmen to boiling water at an additional depth of from 1,440 to 2,000 feet.

The recent investigations of Professor Miller have developed the presence in these waters of the new metals cæsium and lethium, the latter an article now coming into use as a medicine. At the deepest point in the United Mine, the lode, when examined by a scientific explorer, about a year ago, was found to consist, in a great measure, of a loose material of cellular, black-stained, cinder-like pyrites (copper). Both the walls and their metallic contents were so hot as almost to scorch the hand when fairly laid upon them. As the ore by degrees gets worked away, and the excavations remain exposed for any considerable length of time to a current of atmosphere, the temperature decreases to about 83 degrees—the average temperature in a deep mine.

The circumstance of cindery-looking ore accompanying the extremely hot water noticed in some of the mines above alluded to, has led many to attribute the heat to the decomposition of the pyrites; but the absence of sulphates in the water, and the fact that decomposition of pyrites near the surface is not attended with the phenomena of hot water, seems to militate against this idea, and has induced others to look for the cause of the phenomena to more deep-seated sources, connected with the theory of internal fires. We see no reason, however, for the latter alternative, as the heat may be readily derived from chemical sources entirely disconnected with the contents of the vein, that affording merely a ready vent for the heated gasses thrown off in the neighborhood of its greater depth, which would naturally impart their caloric to the water or any other substance with which they might come in contact in their upward course.

OIL OR GAS WELLS IN CHINA.—In the districts of Young Hian and of Meisonug Hian, in China, there exists a large number of salt-water wells extending over a space of about six leagues, which are actively explored by the neighboring population. From the mouth of these wells arise columns of inflammable air, so that if a torch be applied to the opening, globes of fire of from twenty to thirty feet high are seen to arise, shining with a brilliant light. The Chinese arch over these sources of gas with long bamboo tubes, and the gas communicated through these tubes serves to illuminate the machines by which the salt wells, and the places where they are situated, are explored.

MINING REVIEW FOR 1864.

The past year has not been all light and prosperity to the dwellers in California. A long drouth of a severity unprecedented since the commencement of the mining era on this coast, and unexpected reverses in stock operations have more or less affected all, and have brought sore trouble upon not a few. The terrible conflict of gigantic war, which is desolating a large portion of our Atlantic territory has also aggravated, to a considerable extent, the failure of our crops and other calamities in our midst. Prosperity had made us prodigal of the gifts with which the Almighty had blessed us, and we were quite unprepared for the heavy hand of chastening which has been laid upon us. The dark cloud of war, however, is now growing brighter in our Eastern horizon; and copious rains have been poured out upon our thirsty mountain slopes and parched fields, gladdening alike the miner and the husbandman, and giving token of "an early harvest and plenteous year" for both corn and gold.

A careful examination of the mining interest, at this time, can scarcely fail to fill the observer with most sanguine hopes for the immediate future of that great and leading industry. It is quite apparent that we have now passed through the almost fatal epoch of general demoralization, brought upon us by unprincipled speculators, by an unwise impoverishment of our principal mines, and by the inexperience ever attendant upon all new enterprises. Capitalists, who but a short time since had lost all faith in Silverland, and hated the very name of Washoe, are now beginning to express renewed confidence in their value and the exhaustless wealth of our mines.

What though Ophir has ceased for a while to yield its monthly dividends, and Gould & Curry has failed to pay the enormous returns that were forced from it a year ago by an unwise system of working? The history of mines, the world over, tells us that we must look for alternations of wealth and barreness; and mining in Washoe is governed by the same rules as elsewhere prevail. Days of darkness and distrust are followed by the brightness of sunshine. The hill sides and mountain tops of our extended and increasing mineral territory will continue to resound with the pick, shovel and stamps for age yet to come. It is not in the power of this generation, however freely it may expend its energies and means to fully develop, much less exhaust the mines already brought to light.

MINING NOT NECESSARILY SPECULATIVE.

Mining is not all adventure, nor is adventure, judiciously planned, an altogether forbidden thing in the counting house or even in the banker's closet. Very close calculations can be made in mining enterprises on quite slight and inexpensive trials, where experience and calm judgment are allowed the control. The miners of California and Nevada are now acquiring—nay, have already acquired a degree of experience, which if rightly applied may enable them to carry on their work intelligently, and where integrity prevails, there is little risk of loss. Capital, especially from the East, can now be secured to an almost unlimited extent, where good evidence can be given that it will be judiciously expended and honestly guarded.

Now that the excitement of the past two years has fairly subsided, and we are able to calmly observe its unhappy and injurious effects upon individuals and the community, leading people into all manner of extravagant speculations and criminal practices, it is to be hoped, that in the future, we shall be less fickle, less excitable, and more earnest and more cautious in our operations than heretofore. Let honesty, perseverance and patience be directed by indomitable Anglo-Saxon will, and we may remove mountains and uncover wealth, which will ere long render California the monetary and commercial, as she already is the geographical, center of the earth.

THE PROSPECTING MANIA.

The prospecting mania, which has been so rife for the past two or three years, appears to be fast dying out. Notwithstanding vast sums have been expended in this wild spirit of adventure, almost universally to the loss and often to the utter ruin of the adventurers, still a large amount of good is beginning to accrue to the community at large. By it, vast regions of country, which would never have been visited by the plodding and cautious calculator of dollars and cents, have been opened up to the reach of industry and made useful to men. From the first discovery of silver on the Eastern slope, we, as a people, have made great strides in the development of new mineral territory. Our hardy pioneers have forced their way out into forbidding fields, with an energy and enterprise, without parallel in history. Pushing out to the north, south and east, the Californians' pick and shovel, now resounds in almost every part of the vast region between the Rocky Mountains and the Sierra Nevadas, from the Mexican line on the south, to the British border, and beyond, on the north.

SAN FRANCISCO AND THE MINES.

The effect of this remarkable development of mineral wealth, although as yet but faintly shadowed to our vision, has been most wonderful and unmistakable in the growth of San Francisco. Within the past three years this city has experienced, almost exclusively from the source alluded to, its most substantial period of prosperity; and it now boasts of a ratio of increase in population and business which is surpassed by no city in the world. The past season of drouth and general despondency in the interior would have resulted in a perfect panic in San Francisco, had not the late extraordinary developments demonstrated, beyond a doubt, that the mineral field, which looked to this city for its supplies was almost limitless in extent and value. Let not then our capitalists begrudge the money spent in mining enterprises, the past three years, although much that has thus gone out is still "bread upon the waters" not yet returned. The neglect and indifference with which the mining interest was treated by the capitalists of San Francisco prior to 1860, was most suicidal. The change brought about by the discovery of silver in Washoe is even now enriching it beyond all precedent, and attracting to its position the attention of the whole civilized world. San Francisco will hedge up her only source of wealth and prosperity, when she draws her purse strings on the great leading interest of California.

YIELD OF BULLION.

Notwithstanding the general depression of the mining interest which has prevailed to such an extent during the past year, the aggregate result proves, quite conclusively, that this depression has been more apparent than real. Compared with 1863, the aggregate yield of bullion for the past year shows a most remarkable increase. The figures stand as follows:—

Shipments of Treasure for 1864..	$55,707,201
Shipments of Treasure for 1863..	46,071,920
Excess of 1864.....	$ 9,635,281

This increase of twenty per cent. to our yield of bullion is far in advance of the proportionate increase of our population during the past year, and can only be regarded as a most indubitable evidence of the continued and increasing prosperity of the legitimate mining interest of the Pacific coast. It is admitted that there is a certain amount of the above aggregate, which may have been forced from the mines at the expense of more dollars paid, in assessments for working, than was returned from the ore, and there is also a small balance ($1,659,963) of shipments in excess of the reported receipts of bullion from the interior; both of which can account but for a small portion of the excess noticed.

The return to California, during the past summer, of a large portion of the prospectors who crossed the mountains, eastward, during the past three years, appears to have given a renewed impetus to our quartz mining operations. Especially has this been the case in the neighborhood of Grass Valley, in Nevada County, where many mines which had been either entirely abandoned or greatly neglected, are now being worked with most extraordinary success. The great change which has thus been effected has been mainly brought about by going down to a greater depth than had previously been reached. It is a matter of no little importance and interest to quartz miners throughout the State to learn that in almost, if not in every instance, where the mines about Grass Valley have been opened to the depth of two or three hundred feet, they have been found to pay better than near the surface.

With the exception of Nevada county, we do not know that we can refer especially to any portion of California where marked improvement has been noticed in mining, during the past year. The constant receipt of bullion from the interior of the State, however, shows that the miners have by no means been inactive. The unusual low stage of water having rendered the working of the placers impossible, except in a few highly favored localities, it is but fair to presume that more than ordinary attention has been given to mining in quartz. The impetus thus given to that branch of mining cannot fail to have a beneficial and lasting effect upon that more permanent class of our industrial interests.

AN IMPORTANT FEATURE.

There is one feature which we desire to notice particularly in this connection—the increased attention which is being paid, in California, to a closer and more careful working of auriferous quartz. Many mills are now introducing *pans* for more perfectly reducing the sands, and for working the sulphurets. Increased attention is also being paid to the concentration and saving of sulphurets, and several improved machines for that especial service have been introduced to the mining public during the past year. At no time in the history of mining in this State, has there been so much and so well directed effort devoted to a careful and close working of ores of the precious metals as now. The fact is fast being brought home to miners, both in the placer and mill, that there is a large amount of waste in the processes of saving and amalgamating heretofore used, and urgent demands are being made for improvement in that direction. This is a hopeful feature of the day.

VIRGINIA CITY AND VICINITY.

We have noticed no very marked developments in the neighborhood of Virginia City or Gold Hill during the past year. Work upon the leading mines still continues, and with one or two exceptions they are steadily improving. The increased shipments of bullion from these localities, elsewhere noticed more at length, fully attest this fact.

ESMERALDA.

Some improvement has also been noticed in Esmeralda, and several new and promising districts established. The work of development there is far from completion. A considerable amount of Eastern capital is now finding its way to that region, and is being invested there upon the judgment of experienced and capable experts, who have visited these mines in behalf of those interested, and pronounced opinions highly favorable with respect to their permanence and value.

HUMBOLDT.

The Humboldt mines appear to be gradually assuming considerable importance, notwithstanding the unfavorable reports which, for a time gained the public ear. But little effort appears to be made to *create* an opinion favorable to the mines of that region, the proprietors apparently being willing to rest the evidence of value upon the actual development and yield of the mines themselves. Bullion is now coming forward regularly from Humboldt, and will soon increase largely in amount.

REESE RIVER.

The miners of Reese River have attracted a large share of attention during the past season, and an unusual degree of activity appears to have prevailed, among the claim-holders, in the development of their leads. Early in the season, some ingenious and industrious miner improvised a small hand mill, for crushing the "float-rock," which was at that time quite abundant. The remarkable success which rewarded his efforts, induced one and another to attempt the same experiment, until these temporary institutions might be counted by dozens and scores. Though commencing with float-rock, they soon began to put them up for legitimate purposes—many mines having paid the full expenses of sinking shafts and running drifts of exploration by the crushing of select rock taken out. The hand-mill is now being introduced into Humboldt and Esmeralda, and calls are beginning to be made on the foundry men of this city for miniature machinery of this description. A large amount of bullion is now coming forward from Reese River, and it is confidently expected that the receipts from this quarter will form an important item in the present year's aggregate of bullion from the eastern slope.

IDAHO.

Perhaps the most noticeable mining development of the past year, upon this coast, has been that of Idaho, embracing the three districts of the Boise Basin, the South Boise, and the Owyhee. The region in which they are located is embraced between the headwaters of the upper Columbia, or Snake River, and one of its principal southern tributaries, known as the Owyhee. The central portion of this region, or the Boise Basin, is situated about one hundred and fifty miles a little east of north of Star City, Humboldt county, Nevada. Some thirty arastras were at work in South Boise, last summer. There are now some eight or ten mills, either running or about to start, at Owyhee and Boise Basin, and several others upon which the work of construction has just commenced. A very considerable amount of bullion may be expected from Idaho another season. It is thought that the quartz mines there will compare favorably with those of any region yet opened.

THE COPPER INTEREST.

Enough has been done in the development of our copper mines to prove that California must ere long become the richest copper producing country on the globe. A large number of valuable copper mines have been opened. Commencing with the Colorado, on our extreme southern border, where argentiferous copper ore is found of a quality and an abundance met with in no other part of the world, we find a broad and continuous copper belt lying along the flank of the Sierra Nevada, among and just above the foot-hills, and extending, so far as explored, nearly to the Oregon line. A parallel belt is found on the western slope of the Coast Range, commencing in Los Angelee county and extending quite into the State of Oregon. The several prominent locations along the two belts are already quite too well known to the readers of the PRESS to require particular mention in this connection. Large amounts of first and second class ores are being taken out at the principal mines, and shipped to the Eastern States and Europe for smelting.

Nothing of any account has yet been accomplished toward the successful smelting of copper in this State, although, at the present time, much attention is being turned in that direction, and several experimental trials are in progress in different parts of the State, which are promising well. The smelting works at Antioch, on the Sacramento river, have not yet been put in successful operation, although several attempts have been made in that direction. Quite a number of our principal copper mining companies are holding themselves in readiness to commence active mining operations, as soon as they can be directed to some successful enterprise in the way of concentrating poorer ore for shipment, either by some working process, or by the agency of fire. We have the fullest assurance that they will not have to wait much longer.

PETROLEUM.

The fact of the existence of petroleum, on this coast, in large quantities, is now a pretty well established fact. A well of extraordinary yield is reported to have been opened at a depth of only fifty feet, at Buena Vista, Tulare county, during the past month. The process of sinking wells has been commenced, or soon will be, at several other localities. The discovery of a number of oil springs is reported. An important one is mentioned as of recent date, situated on the eastern slope of the Coast Range, about forty miles from Firebaugh's Ferry. Others are reported as having been discovered in the vicinity of Lexington, in the Coast Range about twenty miles beyond San Jose; also in Santa Barbara county. The indications are that petroleum will form an important feature in the "summary" of 1865.

THE OLD VOLUME AND THE NEW.

With the present issue we commence a new volume and a new year. A word, only, for the past. Notwithstanding the unprecedented depression which has been experienced during the past year in mining and all other industrial interests of the Pacific coast, and notwithstanding the unusual withdrawal of the attention of people from common lines of thought to those connected with the great national interests of our country, we have still moved steadily on in the enterprise which we undertook, upwards of two years ago, to furnish the mining and mechanical interests of the Pacific coast with a paper which, as a class journal, should be second to none. Twice, during the year, while many journals around us, both on the Atlantic and Pacific coasts, have been compelled to curtail their dimensions, suspend publication, or advance their prices, we have been enabled to enlarge, until our present issue is nearly three times as large as it was one year ago. Of our past, we feel proud. Of the future, we will only say, that we shall, as in the past, labor faithfully to render the MINING AND SCIENTIFIC PRESS a faithful exponent of the great industrial interests which it is intended to represent, and a really valuable and instructive paper to all.

During the current year we shall present many new features, and place before our mining and mechanical readers, especially, much valuable information, which they will be unable to obtain from any other source. It is our hope, and will be our effort, to so conduct the PRESS in the future as to make our readers not only desirous of continuing with us for another year, but also disposed to aid us in calling the attention of their friends to the usefulness of the paper, thereby increasing our circulation and enabling us to do still more for the improvement of the paper.

Miners and mechanics can depend upon finding in our columns, from week to week, whatever mechanical improvements and processes may be devised in other parts of the world, as well as in our own midst, calculated to improve or simplify their several branches of industry. Many new and original ideas, theories and processes will also be placed before them, as busy and ingenious minds may from time to time bring them to maturity. Persons engaged in mechanical and mining employments can rely upon it that nothing of novelty which possesses value to them in their callings shall escape our notice, or fail to be placed before them through the medium of our columns.

In short, we shall endeavor to render the MINING AND SCIENTIFIC PRESS a necessity for every miner at the mill or placer and for every mechanic as well. To aid us in our efforts, we have secured the services of an able corps of contributors, and to re-imburse us, in part, for those efforts, we shall look to our friends and patrons to render us a generous assistance in extending our circulation.

ELECTION OF OFFICERS.—LA FAVORITA M. Co.—Meeting, January 3d, 1865. Trustees: E. J. Pfeiffer, Martin Fenstermacher, E. T. Anthony and Alexander Hildebraud. President, E. J. Pfeiffer; Secretary, Elkan Wasserman; Treasurer, John Dunn.

NACOSARI G., S. & C. M. Co.—Meeting, January 4th, 1865. Trustees, S. C. Bigelow, C. J. Brenham, Smith Brown, John Caperton, W. T. Coleman, Ira P. Rankin, Levi Stevens. President, Ira P. Rankin; Secretary, T. B. Bigelow; Treasurer, John Sime.

TO CORRESPONDENTS.—We have received, from an attentive correspondent, a lengthy communication concerning the copper interests of Josephine county, Oregon, which will appear next week.

QUERIES, from "N," in regard to copper smelting, etc., will be answered in our next.

REPORTS from the *Candelaria*, *Good Hope*, and *La Favorita* mining companies, received the past week, are necessarily deferred to our next issue.

Bound Copies for Sale.—Bound copies of Volume VIII, complete, of the MINING AND SCIENTIFIC PRESS, from January 1st to July 1st, can be procured on application to the office.

SPECIAL COMMITTEE REPORTS OF THE MECHANICS' FAIR.

COMMITTEE:

W. B. EWER, G. F. DENTKEN.

Cordage.

TUBBS & Co., Agents for the San Francisco Cordage Company, exhibit, from their manufactory, on the Potrero, fifteen coils of Cordage, assorted samples, comprising grades of various descriptions, ranging from the lightest bay rope to the heaviest hawsers, and inferior in no quality of good cordage to the best manufactured abroad. It may even be questioned whether any imported cordage of the kind can be found in this market equal to the samples exhibited by Messrs. Tubbs & Co. The manufacture of Manilla cordage was one of the earliest important manufacturing interests established on this coast. The San Francisco Cordage Company commenced their business in 1856, and have successfully prosecuted it since with a constantly increasing amount of production. They are now engaged in still further and greatly enlarging the capacity of their works, to meet the requirements of a constantly increasing demand. This Company possesses two important advantages over Eastern manufactures for this market—viz: a closer proximity to the sources of supply of the raw material, and the advantage of manufacturing it into such sizes of cordage as the market may at the moment require. The consumption of hemp by this company is now about 1,200 tons per annum, laid down in this port directly from Manilla at a cost of from 9@10 cents per pound—the manufactured article selling usually at 13@14 cents. The highest Premium is due for the cordage manufacture of this Company.

Powder.

The CALIFORNIA POWDER COMPANY exhibit a sample lot of Powder manufactured at their Powder Works in Santa Cruz, which, in perfection of manufacture and in strength, is believed to be equal to any powder offered for sale in this market. This Company has spared no pains or expense in the erection of their works, and it is believed that in excellence of machinery and completeness of equipments that these works are not exceeded, even in the Atlantic States. They have entered upon this enterprise—the first of its kind on the Pacific coast of America—for the purpose of producing here, in California, an article of the first importance to our leading industry, as well as to the safety of the State, which is so effectually isolated from its Eastern sisters that in case of foreign war we should, without this important speciality of manufacture, be almost at the mercy of a foreign power of any considerable naval strength. Aside from these important considerations, there are other and weighty reasons which must readily suggest themselves, why California should not be dependent on distant sources for the supplies of an article of commercial necessity, when we have in our midst the chief part of its component parts as cheaply accessible as they can be found in the Atlantic States or in foreign lands. The establishment of this business has necessarily involved a large outlay of capital, which is greatly increased for the necessities of providing against the dangers consequent upon the nature of the manufacture. With the view of insuring safety in this particular, the works have been located in an extensive and level valley, where the many different buildings needed have been widely separated, yet all connected by substantial tramways and cars. The water-power requisite for driving the machinery has also been conducted to this sequestered spot at great expense. The Company manufactures seven grades of powder—one of blasting powder and six of sporting powder. Premium.

Wire Rope Machinery and Wire Manufactures.

MESSRS. HALLIDIE & Co. exhibited a Wire Rope Machine, of a new and improved character, and samples of Wire Rope, round and flat, and also California drawn wire, the manufactures all being the product of their wire rope factory in this city. The great importance which attaches to this class of manufacture on the Pacific coast, has induced your committee to visit the manufactory, where the samples exhibited were produced, for the purpose of collecting such facts as might be of general interest in this new branch of California industry.

The wire works of Messrs. Hallidie & Co. are located at North Beach, San Francisco, where the proprietors are prepared for the execution of any orders for the manufacture of wire ropes, round and flat, for mining, bridging, agricultural, and other engineering purposes. In order to give the reader an insight into the mode of preparing the wire and manufacturing wire ropes, we will show him the different processes through which the iron rod has to go before it is used for hoisting the heavy mineral from our mines, spanning our rivers, developing our resources, or facilitating our commercial intercourse. Before the heavy coils of round iron are fit to be reduced or drawn into wire for wire rope and other manufacture, they have to be annealed, to soften the metal. For this purpose about 1½ tons of iron coil are introduced into an upright cylinder, of thick boiler iron, about 3½ feet in diameter and 6 feet high, which cylinder is surrounded by a muffle of mason work, leaving a space of a few inches between it and the cylinder to allow the heat to play around it. A flue passes through the center of the cylinder, to allow a uniform heating of the iron coil from the inside. The fire is applied underneath, passes through the cylinder and space between the cylinder and mason-work, heating up the coil, which is placed within. The access of air from the heated coil is entirely shut off by a cover firmly luted into the cylinder top with clay. The time of heating up the coil is about five hours, after which the furnace doors and flues are closed tightly, to retain the heat for a considerable time. After about nineteen hours of cooling, the iron coil is taken out and dipped into a weak bath of sulphuric acid, which removes the slight oxidation of liquid, leaves a clean surface of iron. It is then washed off in sweet water. The wire, after this operation, is passed through a wash of some gelatinous substance, which facilitates the subsequent drawing by furnishing a clear, smooth surface to the wire. The iron coil, after being carefully dried, is now drawn through a die one size smaller than the previous one, being taken up on a drum, in the shape of a car-wheel, on an upright axle, flange downward, which in revolving draws the wire through the die (made of the hardest white cast iron), which reduces its size one number. This process is continued from one size die to the next smaller until the desired degree of fineness is reached. The works are capable of reducing the size of any wire, of any malleable metal, down to No. 28. The wire so drawn to the required size is now ready to be made into rope, after being dryed in a hot-air room as fast as possible, to avoid oxydation. As the machine for making the rope would defy description without an accompanying isometrical sketch, it will only be necessary to mention that it simply lays the strand around a central cord or core of hemp or cotton, without twisting the wire, avoiding thereby the destruction of its fibre. The machines, and the work done by them, were more fully described in the "Mining and Scientific Press" of Sept. 29, 1864. In conclusion, we have to state that the works are capable of making wire rope, of any desired length and strength, of steel, as well as of iron or copper. The advantages of wire over hemp rope, especially for mining purposes, are various and important. It is much more durable; the same strength of rope represents only about 65 per cent. in weight of that made from hemp; it does not shrink in wet weather: is not injuriously affected by the heat of Summer; does not increase in weight in mines by the absorption of water; is as readily and securely spliced as hemp rope, and is quite as pliable when made to correspond in strength. Your committee are pleased to learn that this rope is being rapidly introduced into the mines, where it is becoming very popular by reason of the above mentioned advantages which it possesses over hemp rope for many purposes. The establishment for its manufacture is regarded by your committee as one of great importance to the State; and we are assured by the proprietors that its efficiency and capacity for work will be increased in a ratio to correspond with the growing demand for its production. The especial attention of miners is invited to the economy and increased safety of this class of material, which is beginning to form an important item in the expense of our deep mining operations. Premium.

In connection with the above, it affords your committee much pleasure to call especial attention to the very extensive display of goods manufactured from wire, from the factory of H. T. CRANE, No. 412 Clay street, San Francisco, known as the "California Wire Works." The articles exhibited comprise many articles which are useful, and, in fact, indispensable, to the miner, the miller, the farmer, and others. Among them we noticed particularly very heavy, strong screens, for screening ores of different kinds, coal, etc.; brass and steel wire screens, of various fineness, for quartz batteries; riddles for foundrymen's use; sieves, of various kinds; wire screens, for doors and windows, for excluding flies and musquitoes, at the same time affording perfect ventilation; a great variety of wire frames, for the purpose of displaying all manner of clothing, hats, caps and fancy goods; wire fenders and wire guards, as a protection to children from fire in open grates, as well as a safeguard against accident by fire. Some of these were highly ornamental in their design and workmanship. We also noticed very superior wire cloth for millers' reels and screens, also for tea cleaning, locomotive spark catchers, threshing machine and fanning mill sieves, etc.; also several large and highly finished bird cages, rat traps, of enormous size and of various patterns; wire frames, for supporting carnations and other garden plants, etc. Among the articles exhibited by Mr. Graves, the Summer-house is worthy of very especial mention. It was octagonal in form, twelve feet in diameter, and sixteen feet high to the crown or apex of the dome. The columns at each corner were formed of two spiral wires, crossing each other at regular intervals, thus forming diamond shaped openings. The panels were of what is termed "crimped work," the wires crossing each other in diamond form, and at each crossing being "crimped," or indented, making the whole very firm and stiff. The whole structure, weighing only about 460 pounds, and made in sections, can be easily and safely transported to any distance. With the Summer house were wire chairs, proof against all weathers, light, strong, beautifully made, and very durable. As an exhibition of California manufactures, we consider that Mr. Graves is entitled to much credit, as every article on exhibition (and the display was a large one) was, without exception, wholly of California manufacture. We therefore recommend the award of a Premium.

On Sugars.

COMMITTEE:

J. H. CHURCHILL, A. M. W. B. EWER.

The following is the report presented:—

The subscribers having been appointed on the part of the San Francisco Mechanics' Institute, to examine the products exhibited, and the process of manufacture adopted by the San Francisco & Pacific Sugar Company, have attended to that duty and beg to report as follows:—

We found on exhibition at the late Fair of the Institute a lot of Sugars, unrefined, refined, and in loaves, with various materials, arranged to exhibit to the visitors, the changes which the raw material is compelled to undergo in its progress from its reception in the original packages, until it is fully prepared for the market. The various grades of refined, loaf, crystallized, crushed and powdered sugars give unmistakeable evidence that the Company have arrived at a high state of perfection in their manufacture. They produce sugars which now compete successfully in the markets of the East. Their syrups are held at a much higher figure than those from Boston. The display attracted much attention, and assures us that California and the Pacific Coast has at length been made quite independent of other markets, for the indispensable articles of sugars and syrups. Your committee were supplied with great facilities for inspections, the works of the Company which cover two 100-vara lots.

The external works comprise three cooperage shops—two warehouses for cooperage materials, where forty hands are employed on piecework, at earnings averaging $3 per day—carpenter and blacksmith's shops, the latter furnishing work for five hands—gas works, where gas is made from coal—bone retorts, yielding animal black, of which the stock in use is 420 tons, with a loss of 25 to 30 per cent. per annum: these retorts are connected, when required, with the gas main: the bones vary in cost from $8 to $16, according to their solidity—a detached house for the five boilers in use—four pumps, working together, and drawing water, from independent sources of supply, in strata varying from 125 to 270 feet below the surface. Two thousand gallons is the daily supply for condensing purposes, this being almost the whole demand; much is reused after cooling in two shallow reservoirs holding 150,000 gallons.

The construction of these reservoirs is cheap enough to be noteworthy—clay is lasted over a bed of sand and the deposit, at a thickness of half an inch, is sufficiently retentive, and is easily repaired in the same way.

The main buildings consist of the melting house, the white sugar house and the yellow sugar house. The first is traversed by a roadway, by which the raw sugars enter the works. Sixty-five thousand pounds from all parts of the world, are weighed in daily. Grinding on an iron plate, with rollers worked under water, is the first operation. The sugar is here dissolved in distilled water: a small quantity of sand at the bottom and the scum and floating material at top, are alone what is separated here. The sugar, thus melted at the lowest possible heat, is drawn off in the cellar below, and thence pumped without further change to the seventh story of the same building—this stage consumes one hour. There it is first distributed into vats, where precipitants are used—some of these are imported. Raw steam is used for heating: and sprinklers kept at hand to control any foaming, precipitation is not waited for, but the syrup, still high colored, is run down to the floor below, to filters, consisting of bags six feet deep, into which it is distributed, by flowing it over iron plates pierced with the brass pipes which form the mouths of the bags; 480 yards of filtering surface are thus arranged in cubes, four feet square and eight feet deep: a ton and a half of mud is removed daily. The waste contains still enough color and sugar to be attractive to distillers. This waste is discharged through a pipe, in which its motion is quickened, when necessary, by a steam jet. It is afterwards pressed, to leave as little as may be for the distiller. The disolved sugar is then passed lower to the important stage in which the animal black, from the bones burnt outside, forms the active agent. This is employed to remove not only the color, but the taste and smell which distinguish raw sugars. This it does by being retained, in contact, in deep circular iron vessels: 12 tons of charcoal with 12 tons of raw sugar, on the average thus keep each other's company for twelve hours. Afterwards water is passed through for 72 hours in the same vessels.

The restoration of the charcoal—of which this is the beginning—forms a separate process. The sugar passes, meanwhile, through pipes to the sorting room, where samples are made to exhibit themselves in glass vessels, and the contents of the correspondeng pipes are run into vats below, or again forced to the top of the animal black filters, when too discolored for mixing. From these vats the requisite proportions for any grade are taken, by pumps, to the vacuum pans, situated in the story over the melting room. Here they are boiled, under a pressure maintained below that of the atmosphere, by a continuous discharge of water downwards through a condenser, which is connected directly with the pans. The heat is wholly supplied by steam, admitted to the casing and the worms in the inside. The utmost cleanliness is necessarily preserved throughout; daily washing of the vats, pumps, filters and faucets is resorted to to obviate any fermentation. Centrifuga whingers are used for the filtering bags.

The syrup in the vacuum pan is reduced to a consistency suitable for crystallizing, and then run into large vats, from which it is conveyed, still hot, in steam-cased pipes. It next appears in moulds, of conical form, such as may be supposed to cover ordinary white sugar loaves. In these it is allowed gradually to crystallize, when the syrup left is allowed to drain off. These loaves are dried in a stove, at a temperature of 150 deg. ces, and are broken down in crushing mills, in an upper story, to which they are hoisted, thence descending, through riddles, to the barrels and boxes, from which the grocers present them to their customers.

The process by which the syrup is completely extracted from the loaves is of interest, as being one transferred from the laboratory to the working room. Water, saturated with crystallized sugar, is passed through the moulds, and in flowing out carries with it the remnants of the syrup, while it is incapable of carrying off the solid sugar. The principle involved has found similar applications in other manufactures.

The process of restoring the charcoal, which occupies so large a place in this manufacture, consists in heating it to a red heat, cooling off, re-washing, and returning it to the filters. These operations have to be conducted continuously, fresh supplies have to be prepared, and the whole is arranged to time with the regular flow of the syrup from the melting house to the roof, and thence again to the ground floor—measures almost automatic in their management. Saccharometers and guage pipes furnish the control which maintains this harmony. Economy is further assisted by the completeness of the machinery for pumping, by the care with which heated surfaces are protected from radiation, by double glazing in windows, by the use of small vertical retorts arranged in large groups, and by the recovery of the waste heat from the cooling animal black, which is employed to heat some part of the large quantity of water evaporated every day.

As a provision against accidental delays, four expensive centrifugal stralners, with detached engines, are maintained ready for any emergency. How urgent these may be will be seen, when it is known that a careless hand neglecting to shut a door in one of the heated rooms, may delay work for days—valuable will appear the care bestowed on covering the steam pipes, when their measure is reckoned in miles. Many of the operations have to be checked at various times of the day. Such ability required in the management of our Pioneer sugar Refinery.

This manufacture is doubtless important. By it the consumers of thirty tons of sugar per day are enabled to eat or drink a well-cleansed and wholesome article. On the other hand, we see the labor of 2.5 men—the energies of 25 tons of Mont Diablo coal, transmitted through nine steam engines—and the skill which can direct these to effecting such various operations, with concert of purpose and regularity of result—all these applied to removing 3,000 pounds of mud and other matters, which formed no part of the original cane juice. Premium.

Glass.

COMMITTEE:

J. H. CHURCHILL, A. M., W. B. EWER.

Your committee report as follows:

The exhibition of this manufacture made by the PACIFIC GLASS WORKS COMPANY at the late Fair of the Mechanics' Institute and at the works of the Company, situated at the Potrero, have been carefully examined by us with varying satisfaction. The first may be deemed a very successful *exposé* of what is possible with capital and skill. The enterprise which so fully developed the various capabilities of their manufacture is very commendable, and one which should weigh with importers. We noticed, with no little satisfaction, the development of an idea suggested by one of us, not many months since, as to the value of the glass manufactured here for chemical ware. Retorts were exhibited which might well be substituted for those imported. The Company, at the time of the Exhibition, had been in active operation about fourteen months. They manufacture a great variety of green, blue, and black bottles, carboys, trull jars, etc., of any desired shape, with increasing facilities for every description of druggists' ware. Tinted lamp chimnies were shown, such as were long since successfully introduced by Bettles & Co. in London. Telegraph insulators, and other kinds of blown and pressed glass, are offered at a cost below that of imported ware. The advantage of moulds bearing the trade-marks of our home manufacturers is an important one, while the fragile character of the product is considered and the delay incurred in obtaining shipments from the East.

The growing industries of our State are a wide field for the future success of this Company, so enterprising in carrying out their wants. This success in this part would be even more assured than it is, if they could rely on native supplies of the few manufactured articles and tools which they require. Every allowance must be made on this account, while the perseverance which is to overcome them is a feature which reflects great credit on the present programme of the Company. Your committee also personally inspected the works of the Company at the Potrero. They found them only partially in operation, as preparations were being made for the regular relays of the principal furnaces. They regretted to observe evidences of the want of personal superintendence, which is as manifestly a necessity of the business of a public company as of that of a private firm. The raw materials of this manufacture, like those entering into the class of goods furnished by this Company, are not numerous, and California has abundant—probably very superior—supplies, and some within easy reach. Those which have been obtained seem to have been applied with very little regard to their capabilities; yet there is scarcely a manufacture in which an exact knowledge of the constituents of the materials daily introduced into the works and pots is more required to ensure the production of any desired grade, or even to maintain uniformity in quality to the commanding the market. Men outside of glassworks will appreciate this necessity, if we compare it to that required in the management of fluxes. The proper application of the materials is based on the same principles—the control of the result is here easily secured.

In certain respects an extravagance is exhibited, which exceeds that of a quarter of a century ago in other works, or which could only be warranted by the manufacture of the most expensive glass. Part of this is doubtless the usual accompaniment of early business, but seems to have been exaggerated in this case by adherence to an error, which has been the bane of so much misapplied labor here and elsewhere—viz: that a successful "practical man"—meaning thereby one who has acquired experience by continued application to details or detached parts of a business—is the right man in the right place to organise a new work in all its branches; to search out and select materials, and manipulate them in successive operations; to devise constructions for brick and iron work; to superintend workmen; to arrange the supplies within the limits of finances, to be obtained with as little certainty as assessments; and, finally, to furnish the product with the regularity, which is a necessity to meet a paying demand. The idea is still current that the only antithesis to this is to employ a man who has had no experience in anything. This is called a theoretical man. We venture to suggest that the true remedy is an organization based upon the capabilities and requirements of the whole of the details, and the employment of labor skilled in each division, solely in its own branch. We assume that no apology is necessary for thus speaking of a subject which is still dividing the opinion of shareholders in this Company, one of such promise and of such certain capabilities if thoroughly worked. Premium.

Trusses.

MR. A. KOHLER exhibits a show case of Trusses, Braces, Supporters and Bandages for weak ankles, crooked legs, club-foot, and surgical purposes. The articles are fully equal to any in the market, and are all of California make. Premium.

FREDERICK KESMODEL exhibited a Truss of a peculiar construction, designed by himself. This truss is made from a cast of the rupture, which is first taken and the truss subsequently formed, so that its surface shall correspond exactly with the part to be supported. This peculiarity of construction, as well as perfection of finish, is deemed worthy of special mention.

BLUE LEDGE M. Co.—The office of this Company has been removed to Nos. 8 and 10 Government House, our excellent friend, J. M. Buffington, having recently been elected Secretary.

A Mining Phenomenon.

The effect of a current of warm air issuing from a mine in a cold day is sometimes quite remarkable, often giving the mouth of the mine the appearance of a huge steam discharge pipe. This phenomena is properly described, as follows, by the Virginia *Union*, in an account of a recent visit to the Savage mine near Virginia City :—

We stopped a few minutes to watch the operations at the old hoisting works of the Company. Every moment or so a car, loaded with ore or waste dirt, would come rushing up the shaft to the surface, to be rolled out and sent thundering down the dump, where numerous heavy quartz teams were waiting to transport the ore to the mills. But to one uninitiated in such things the strangest phenomenon was the immense volume of steam which came rushing forcibly up and out the mouth of the shaft, enveloping the brakeman and the hoisting machinery in a dense fog, which, condensing, kept everything dripping with water. One would naturally suppose that some heavy steam machine was blowing off away down in the bowels of the earth. The philosophy of it is simply this, which we would state for the benefit of those who are not familiar with such things : In all shafts consisting of two or more compartments, a strong current of air invariably and unceasingly pours down one compartment and up another. Even when there is no air stirring on the surface, this current will pour up with such force that a newspaper, or other article, will not drop down that part of the shaft ; and if thrown will immediately return to the surface. The air, in the depths of the mine, is many degrees warmer than at the surface, and like all heated air has a tendency to rise ; therefore, gathering in from the different drifts and chambers, it finds egress through the shaft—the supply and circulation being kept up by air shafts in different parts of the mine. This warm air, on arriving at the surface during the cold weather, and especially on a frosty day like that on which we made the visit in question, assumes the form of steam, and being condensed by the cold air, drips from everything which it envelops. Of course, in warm weather none of this steam would be seen, for obvious reasons. It is decidedly an interesting sight to stand and see car after car come swiftly up to the surface, on the " cage," or little square platform, at the end of the big rope ; and occasionally, while you are looking, a man will come bouncing up on a cage from the bowels of the earth, with startling suddenness, reminding you of one of those wonderful little painted boxes to be seen at any toy shop, which, if you unhook the lid, it flies back and a hideous little witch pops up before your astonished vision.

In the year 1865 there will be four eclipses—two of the sun and two of the moon. The eclipses of the sun occur on the 25th of April and the 15th of October ; those of the moon on the 11th of April and the 3d of October.

The income of the California Branch of the United States Sanitary Commission is now about $1000 per day from Soldiers' Aid Societies in different parts of the State. There are over 200 societies in operation.

For Advertising Assessments on Saturdays.

Levy your Assessments upon any day EXCEPT FRIDAY.

Advertise the ASSESSMENT NOTICE on the FIRST FOUR SATURDAYS succeeding the day upon which the assessment is levied.

Appoint the day for advertising the DELINQUENT SALE on the FIFTH SATURDAY succeeding the date of levying the assessment.

Appoint the DAY OF SALE on the SEVENTH SATURDAY succeeding the date of levying the assessment, or any day *previous* to the Eighth Saturday.

Assessments ordered upon Saturday afford the Secretary the longest term in which to effect his advertising at the mine.

Extracts from the Statutes.

The attention of companies who desire advertising their delinquent sales in any other paper than that in which the notice of assessment appears, is called to the following section of the law approved April 4th, 1864:

Section 7. If any portion of the assessment mentioned in said notice shall remain unpaid on the day specified therein for the publication of the notice of sale, the Secretary shall, *unless otherwise ordered by the Board of Trustees*, cause to be published in the same papers in which the notice provided for in section five shall have been published, a notice substantially as follows, &c.

If, from a matter of convenience or necessity, the publication of an assessment is delayed, a very simple remedy is found in the following section of the law, relating thereto:

Section 14. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the nonperformance of any act required to be performed in order to enforce the payment of the same; but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall be void, and publication shall be begun anew

A Few Facts About Brazil.—The empire of Brazil has by far a greater territorial area than any other South American State some 3,000,000 square miles. Its greatest length from north to south is 2,450 miles, and its greatest breadth 2,630, while it has a coast line of nearly 4,000.

The greatest mineral wealth of Brazil lies in its diamonds, the most inferior sort of which comes from the province of Bahia, the port now celebrated by the seizure of the *Florida*. Gold, silver and iron are found in small quantities, and mineral coal of an inferior quality is also obtained.

The principal agricultural product, however, is coffee, half the world's supply being furnished by that country alone. The annual exports of coffee from Brazil to the United States alone, before the war, averaged more than 180,000,000 pounds.

The population is nearly 8,000,000, distributed over twenty provinces of mixed races and colors. The Government is a hereditary, limited and constitutional monarchy.

The standing army numbers about 20,000 men; and in addition there is a National Guard of about 100,000 men, similar to our militia in character. The Brazilian navy consists of about 100 vessels—over 30 of which are gunboats. The total naval force cannot be less than 5,000 men.

Use and Abuse of Ice.—The drinking of iced liquids in considerable quantity is highly injurious, and in some cases their use has been attended with inflammation of the stomach and bowels, and even sudden death—not always accounted for by the person being at the time in a heat. Ice, or iced water, retards digestion, chills the body, and often produces most dangerous congestions. On the other hand, ice or iced water applied in inflammations, croup, etc., has been productive of the best effects; it diminishes the quantity of blood in the vessels, and carries off the excess of heat. A piece of ice laid on the wrist will, in many cases, stop bleeding of the nose. If milk or butter is cooled with ice, it must be used at once, otherwise it will lose its freshness.

Singular Catastrophe.—An accident of a most singular character occured on the Chicago, Burlington and Quincy Railroad, a few nights ago, attended with fatal results. A locomotive was standing upon the track at one o'clock at night. Why it was there, in a place of such imminent danger, at such an hour, it is impossible to conjecture. But the most singular part of the story is, that two trains, one from the West, and the other from the East, plunged into this luckless locomotive at the same moment of time, smashing all three of the locomotives and cars, and killing some twelve or fifteen passengers. At the point where the collision took place the road is perfectly straight and level for miles, and the catastrophe is one of the most remarkable on record.

The Late Professor Silliman.—The New Haven Courier, speaking of the last days of Professor Silliman, Sr., says:—

"Professor Silliman was attacked about ten days since, somewhat severely, but not alarmingly. After an illness of two or three days, he began to recover, and from that time his friends have dismissed all apprehensions and have regarded his full recovery as certain. On the morning of Thursday he awoke, after a more than unusually comfortable rest, and promised himself the satisfaction of uniting in the public services of the day of National Thanksgiving. He uttered a brief prayer, as was his wont, repeated two hymns, which he followed with a few words of affection to his wife, unconscious of the significance of each act, and then was in a moment translated to that state whose very life and atmosphere are continued adoration and perfect love."

IMPORTANT DISCOVERY

—IN THE—

Photographic Art.

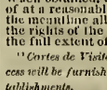
Jacob Shew's

CHROMATIC PROCESS OF PRINTING PHOTOGRAPHS.

[PATENT APPLIED FOR.]

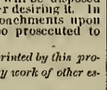
THE UNDERSIGNED WOULD ANNOUNCE TO THE public that he has discovered a new and IMPROVED PROCESS for printing Photographs, which produces a

SOFTNESS, CLEARNESS AND DELICACY OF TONE



unattainable by any other known process and to which he has given the above name. It is applicable to any size of Photograph, and those having valuable old negatives which they desire printed by the improved process can do so at any time.

In order to secure the pecuniary advantages to be derived from this important discovery a patent has been applied for. When obtained, the privilege of the right will be disposed of at a reasonable rate to any Photographer desiring it. In the meantime all are warned against encroachments upon the rights of the discoverer as such will be prosecuted to the full extent of the law.



"Cartes de Visite" and large Photographs printed by this process will be furnished at the prices of the ordinary work of other establishments.

☞ The public are invited to examine specimens at my Gallery. ☜

THE UNION AMALGAMATOR.—Our attention was called, a few days since, to this new amalgamator, the invention of Mr. W. L. Strong, which is now in operation at the Metallurgical works of Messrs. White & Murphy, on Bryant Street, between Third and Fourth, in this city. This is the first pan which has been made after this pattern. It is only about one third the size of the ordinary pans, and yet Messrs. White & Murphy assured us that it would accomplish about as much work in a day as the largest size of those in general use. The construction of the pan is such as to enable it to be run at a very high speed—the revolutions of the mullers being nearly three times as rapid as those of the pans generally in use. It is this rapid motion that enables it to accomplish such an extra amount of service. The mullers are attached to two separate sets of arms, which revolve in opposite directions—the outer set moving at about half the speed of the inner one. This opposite motion produces a most violent and peculiar agitation of the pulp, by which a circle of eddies is formed at intervals around the shaft, and half way to the circumference of the pan, which cause a constant movement of the pulp from the surface to the bottom, and *vice versa*—passing it constantly between the grinding planes, and thence upward to the surface, to be returned again through the eddies as above. The attention of miners, and all others interested, is called to this pan, which may be seen in constant operation at White & Murphy's works. It is extremely simple in its construction, and may be as readily cleaned up as any pan in use.

THE NOVELTY AMALGAMATOR.—We would call the attention of our mining readers to the advertisement, in another column, of Mr. Hopkins, the proprietor of the Novelty Amalgamator, which attracted so much attention by its operation at the late Exhibition of the Mechanics' Institute in this city. One of these amalgamators, of a size capable of working 1800 lbs at a single charge may now be seen at work at the Miners' Foundry on First Street, where the proprietor is always present to explain its principles and advantages to all who may take sufficient interest in such machinery to call and examine it. Much attention appears to be directed, at the present time, to the cylinder form of amalgamator, which undoubtedly possesses many advantages over the ordinary pan. The chief drawback to the employment of the cylinder, has heretofore been thought to consist in the difficulty attendant upon making the boxes sufficiently tight to exclude the sand, the admission of which would soon destroy both journal and box. Mr. Hopkins feels assured that he has fully accomplished this end by the use of a box made upon the principal of a steam packing joint, for which he has taken out a separate patent. Mr. Hopkins will take pleasure in showing the construction of this novel journal box to visitors.

THE SAN FRANCISCO LEAD MANUFACTORY.—Workmen are now engaged in sinking an artesian well on the vacant lot on the southeast corner of First and Howard streets. The work of excavation is also in process, upon the same lot, preparatory to laying the foundation for the lead-pipe manufactory, the machinery for which recently arrived in this city. We understand that a shot-tower will be erected in connection with the manufactory.

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the PACIFIC FOUNDRY,
10v1 San Francisco.

SALMON'S
PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

No.	Fine		No.	Fine
Assay.....	250	943	Assay 300	990
Assay.....	285	941	Assay for Gutman	980
Assay.....	286	940	Assay Water Rock	966
Assay.....	291	950	Assay Water Rock	998
Assay.....	.. ..		St. Helena Ledge, W. D.	966

These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assays. Parties interested will find it to their advantage to call and see the above machine in operation. Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,
To whom all orders should be addressed. 15

HUNT'S
IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

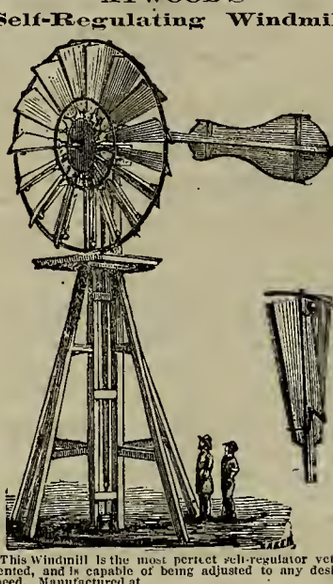
HUNT'S ENDLESS CHAIN

HORSE POWER

For Sawing Wood,

ALSO, THE

Self-Regulating Horse Power



Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

E. O. HUNT,
No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

ATWOOD'S
Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

IMPROVED WATER-WHEEL,

—PATENTED BY—

JOHN TYLER, WEST LEBANON, N. H.

Giving the Maximum Power with the Minimum Cost; Having the Following as Some of Its Advantages Over Others—Giving the Best Percentage of Water Used, Durability,

It runs Equally as well IN Back Water as OUT.

IT IS ADAPTED TO HIGH HEADS OR LOW—IT IS NOT LIABLE to get out of repair—It can be put to running by any Machinist in a very short time—It is the steadiest running and easiest regulated wheel in use—There are now some 500 of them in use in the United States and Canadas, running under all heads, from 4 to 80 feet, and giving universal satisfaction. Address

SMITH & HANSCOM,
15v8-3m Golden State Iron Works, San Francisco.

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phenix Mill, etc.

☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. between 3d and 4th.

[Illustrated in the Mining and Scientific Press, April 9th, 864.]

HEPBURN & PETERSON.
nov8 3m*

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast, amalgamate, assort, cupellate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. B. FAUCHERY, Engineer,
9v24

FARRAND'S
Oscillating Amalgamator,

RECEIVED THE

ONLY PREMIUM

AWARDED FOR AMAGAMATORS

At the Recent Industrial Fair

OF THE

Mechanics' Institute of San Francisco.

Committee of Awards.

O. BELDEN, O. GOAT, W. T. GARRATT, GEO. JOHNSON, H. P. WAKELEE, C. M. RADCLIFF.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulppurets, as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

W. D. FARRAND, Inventor,
R. L. OGDEN, Agent, SAN FRANCISCO.
S. E. corner Montgomery and California streets.

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber is also perfecting a HAND MACHINE for Miners engaged in prospecting, which will work 25 pounds of ROCK at a time, and which will weigh about 125 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,
At the Novelty Iron Works, Nos. 37 & 39 Fremont street.

PRATER'S
PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNOERFORD & PRATER, Proprietors.
San Francisco, April 1st, 1864. 14v8-tf

Disney's Cylinder Amalgamator.

The Cheapest and Best.

DISNEY'S CYLINDER AMALGAMATOR, WHICH HAS recently been introduced to the public, has already been proved a complete success, and can be furnished, at a price cheaper than any other in use. It is simple in construction, and so arranged as to do a large amount of work with the smallest expenditure of power. The proprietor is satisfied that he can do more work in a given time and with a given expenditure of power than any other amalgamator in use. For small companies who desire cheap yet effective machines, none can be more desirable.

It may be seen in operation at the Rail Road Foundry on Fremont street where

A NEW CRUSHER

is in operation and he can crush and Amalgamate at the LOWEST RATES. Miners and all others interested are invited to call and examine for themselves.

M. DISNEY, Patentee.
San Francisco, June 23, 1864. 1-3m

New Mining Notices.

Astor Gold and Silver Mining Company, Gold Hill Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 4th day of January, 1865, an assessment of two dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold and silvercoin, to the Secretary, No. 436 Jackson street, San Francisco, or to E. A. Hyde, Superintendent, Gold Hill.

Any stock upon which said assessment shall remain unpaid on Saturday the 4th day of February, 1865, will be advertised on that day as delinquent, and unless payment, shall be made before, will be sold on Saturday, the 18th day of February, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

EDWARD C. LOVELL, Secretary.

Office, No. 436 Jackson street, San Francisco. 1-4

Agnwam Gold and Silver Mining Company, Nye County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 4th day of January, 1865, an assessment of one dollar per share was levied upon the Capital Stock of said Company, payable on the 7th day of January, 1865, in United States gold coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 11th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Friday, the 3d day of March, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

G. M. BURNHAM, Secretary.

Office, No. 509 Clay street, San Francisco. jan7-1-4

Ashland Mining Company, Moss Lode, San Francisco District, Arizona.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 6th day of January, 1865, an assessment of fifty cents per share was levied upon the capital stock of said company, payable on the 30th day of January, 1865, in United States gold and silver coin, to the Secretary, at his office, No. 613 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Monday, the 30th day of January, 1865, will be advertised as delinquent on Saturday, the 4th day of February, 1865, and unless payment shall be made before, will be sold on Saturday, the 18th day of February, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. T. KNOX, Secretary.

Office, No. 613 Montgomery street. jan7-1-4

Animas Silver Mining Company, Ventanas, District of San Dimas, State of Durango, Mexico.

NOTICE.—There are delinquent upon the following described stock, on account of Assessment levied on the 3d day of December, 1864, the several amounts set opposite the names of the respective shareholders, as follows:

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Grinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water, or Steam Power. For further information address W. W. HANSCOM.

1 Colden State Iron Works, San Francisco.

THE NOVELTY.

This Rotary Cylinder Amalgamator did not receive the premium at the Industrial Exhibition. The one there displayed worked one hundred pounds at a charge, and was classed merely as a model, honorable mention of which being made by the reporting committee. The proprietor is now manufacturing some of the larger size of this machine, capable of working Two Thousand Pounds at a charge, and requiring no more power than is necessary for the pans now in use working but one-third that amount. This machine is simple in construction, durable and compact, very easy to clean up, and, in fact, is a perfect machine.

In offering his Amalgamator to the mining public the Proprietor does not claim to have found the "Philosopher's Stone," nor any new method of extracting the precious metals from the ores, but does claim, as a practical mechanic and worker on mining machinery, that there was room for improvement in that direction, and that he has, by careful study, invented his improved ROTARY CYLINDER GRINDER AND AMALGAMATOR, known as the "NOVELTY," which mechanically overcomes the many difficulties that have heretofore arisen in the art of amalgamating ores.

This invention consists of a cylindrical-shaped case placed horizontally on legs, and provided with dies one and a half inches thick, making seventeen square feet of grinding surface, and having a rotary oblique muller (or more) placed within it, and covered with shoes one-half an inch in thickness, and so constructed that all particles of rock must pass between the shoes and dies, causing it to be thoroughly reduced. The process of amalgamation is similar to that of the German Barrel, but much more rapid than that or any other amalgamator. Heretofore, the chief objection to cylinder amalgamators has been the great wear and friction to which the journals were subject; but in this amalgamator that difficulty has been entirely overcome by the use of an adjustable metallic box, a new invention, that acts for the double purpose of a metallic packing and a journal box, and works to perfection.

This machine, when seen working will convince any practical man of its superiority over all others of the kind, and the public in general, and Miners and Millmen in particular, are invited to call and examine it while in operation, at the Miners' Foundry, where they are now being constructed.

All orders should be addressed to

H. L. HOPKINS,

Inventor and Proprietor.

Miners' Foundry, San Francisco, Cal. 10v1

Vulcan Iron Works Company

[ESTABLISHED 1850.]

First, Natomd and Fremont Sts.

IRON FOUNDERS,

Steam Engine and Locomotive BUILDERS,

Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These works have lately been increased by the addition of new shops on Fremont Street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequaled in the State. Their Boiler Works have also been enlarged correspondingly.

The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as

Mining, Steamship, and Steamboat Machinery,

Railroad Machinery, Locomotives, Car Trucks, Car Wheels, Housings and Irons; and Flouring Mills, Quartz Mills, Sugar Mills, Saw Mills,

Manufacturing Machinery of Every Kind.

Sole Manufacturers of

HEPBURN & PETERSON'S REDUCINO PAN AND AMALGAMATOR;

MOORE'S IMPROVED HOWELL QUARTZ CRUSHER;

HOPE'S AMALGAMATOR AND SEPARATOR;

FAUCHERY'S QUARTZ GRINDER AND WATER WHEEL;

JONVAL'S IMPROVED WATER WHEEL;

STEVENS' PISTON PACKING RINGS.

They have also a large assortment of Patterns for Pumping and Hoisting Machinery, Gearing, Pullies, Water Mill Irons, Hydraulic and Screw Presses, Retorts, Furnaces, Grate Bars, House Fronts, Ornamental Fence Posts and Paling, Stoves, Ranges, etc., etc.

Quartz Stampers, Shoes and Dies, of the best Hard Iron. Quartz Screens of Russia Iron Punched to Order. 27

MINING AND SCIENTIFIC PRESS.—This well conducted journal has entered upon its ninth volume. It is a sterling periodical, and deserves encouragement.—*Territorial Enterprise*

For Secretaries' Reference.

Safe Rules for Advertising.

Make your order levying the assessment on any day EXCEPT FRIDAY, and advertise the Assessment Notice on the FIRST FOUR succeeding SATURDAYS, setting the day for delinquent advertising on the FIFTH SATURDAY, and the day of sale on the SEVENTH SATURDAY, or any day thereafter, PREVIOUS to the EIGHTH SATURDAY.

ADVERTISING IN THE INTERIOR.—If the mine or works of the corporation are located in any State or Territory of the United States, notice must be advertised there also, if a newspaper is published in the same county. On this account, SATURDAY is the best day on which to levy assessments, as thereby the longest period possible is gained for transmitting a copy to interior papers, which are usually published on Saturdays.

POSTPONEMENTS.—The date set for advertising delinquent stock, and the day of sale mentioned in either notice, may be *once* postponed for any period not to exceed ten days. Secretaries can avail themselves of this privilege when assessments are levied on Friday and they are obliged to advertise at the mine on Saturday, or desire to publish on that day at the place of incorporation.

ERRORS, OMISSIONS, OR DELAYS are definitely provided for in Section 14 of the new law, whereby it is plain that, if the advertising is delayed, the Secretary can only fix the dates for delinquent advertising and sale to suit the time he is to advertise, and proceed auew.

WHEN PAYABLE.—It is the usual custom to make the assessment "payable immediately," or upon some date within a day or two from the time of levying the assessment, although the law makes no requisition as to this matter.

BLANKS FURNISHED FREE to advertisers in the MINING AND SCIENTIFIC PRESS, for Assessment Notices, Delinquent Sales, Postponements, etc.; also copies of the Assessment Law of 1864. Copies of advertisements, for sending personal notice to shareholders, printed at $1 per hundred.

The PRESS is the most ECONOMICAL advertiser for stockholders, reliable and obliging for Trustees and Secretaries, and merits the patronage of the mining interests.

To Mining Secretaries.

We positively refuse hereafter to receive advertisements of any mining company for the payment of which the Secretary is unwilling to vouch. We shall also exercise the right to eject from our columns, at any time during the course of publication, any advertisement for which payment is not made, or security given upon proper notification.

DEWEY & CO.,
Publishers Mining and Scientific Press.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

To the Public and to Millmen in Particular.

As Thomas Varney has not, up to this date, withdrawn his notice in the "Mining and Scientific Press," in which appears the following language:—

"All persons are warned against purchasing machines made at the Miners' Foundry, called 'Wheeler's Amalgamators,' as they are an infringement on my patent, and a suit is now pending in the United States Circuit Court, against the parties infringing;"

In justice to myself I am compelled to give to the public a statement of the facts in the case, and show the position which Mr. Varney and myself occupy as Patentees. He commenced suit against me, and the Miners' Foundry, for $90,000, about the 1st of March 1863, and threatened suit against any and all persons who should buy my amalgamators, thus greatly damaging my business. To show the injustice of this suit against a "poor hard working mechanic," I will quote from the opinion of Judge Hoffman, as rendered in the case last November. He says:

This is an action for the infringement of a patent issued to the plaintiff on the 16th of December, 1862, for an "Improvement in Amalgamators for gold and silver." The machine alleged to be an infringement has also been patented—the patent being dated December 8th, 1863. The defendants deny the alleged infringements, and the novelty and originality of the plaintiff's invention. They have also given notice, under the statute, of various other defences, hereafter to be noticed.

Models of the two machines were exhibited in Court, and a large number of witnesses called to explain their construction and mode of operation. It is apparent that the patented machine of the defendant closely resembles, if it be not substantially identical with, the improved and modified machine now manufactured by the plaintiff. But the inquiry is not whether Wheeler's machine resembles that lately used by Varney, but whether the former is substantially the same as the machine described in Varney's patent. That Varney has, in many important particulars, modified the machine as described in his patent, is obvious. Indeed, his late machines resemble much more nearly in external appearance, and in their mode of operation, the Wheeler patented machine than they do a machine constructed according to the drawings and specifications of his patent.

After describing Mr. Varney's pan and its operation, the Judge says:

It appears, however, that the idea of working ores in a batch, by causing them to pass repeatedly between mullers, the upper one of which is provided with openings at the center, is by no means novel.

J. E. Clayton testifies that, so long ago as 1845, he arranged a machine in Tallahoosa, Alabama, for the reduction of gold ores, which embodied substantially the same principle.

* * * * * * *

In Overman's Metallurgy, p 267, a similar arrangement is described. * * It is evident that the author is here describing an existing and well known machine, the usefulness of which has already been ascertained.

It is also apparent that the result aimed at is the same in this machine as in that of the plaintiff, and that the means adopted to accomplish it are substantially similar. In both machines the pulverization of the ore is effected by means of a bed plate upon which a muller rotates, with central openings to permit the pulp to pass continuously and repeatedly between the grinding surfaces until the operation is completed.

Amongst other things the Judge quotes the following from Judge Story:

But in all cases where the patentee claims anything as his own invention in his specification, Courts of law cannot reject the claim, and if included in the patent and found not to be new, the patent is void, however small and unimportant such asserted invention may be.

* * * * * * *

Here the plaintiff claims a particular position of machinery as his invention, and it clearly appears in evidence that the position is not new. It has existed before—not in machines exactly like the present, but in machines applied to analagous purposes, viz: in machines applied for the same purpose as the plaintiff applies them. The objection therefore, is fatal.

In the defendant's machine, the pan in two parts, provided with flanges, packing, &c., to which the plaintiff in his patent attaches so much importance, is not used, but a deep pan is substituted with a wooden cover.

The arrangement of the slots or shoes on the muller is different. The upper muller is provided with spiral ridges arranged to operate with similar ridges reversally inclined on the inner surface of the pan, to raise the pulp and promote the circulation. The upper muller is attached to the shaft by an universal joint, and by a mechanism qu to dissimilar to that described by the plaintiff. And for the scrapers are substituted broad guide plates extending and secured to the edge of the pan, and capable of being elevated or depressed by means of a mechanism not found in the plaintiff's machines.

Assuming then—as in the point of view in which we are considering it we must—that each of the several parts of the plaintiff's machine is old, and not separately patentable, it seems clear to me that if the patent for the machine can be sustained, as for a new combination; which I think doubtful, the combination of the defendant is at least as novel as that of the plaintiff.

We have already seen that the muller rotating upon a bed plate, with central openings, and arranged in a pan so as to create a circulation of the pulp, is not a new invention. The tub, composed of two parts, with flanges, packing, &c., is not claimed to have been used by the defendant. In fact it is now discarded by the plaintiff, and a deep pan, with muller attached by an universal joint, has been adopted by him in his later machines. The infringement, if any, must consist in the use by the defendant of the scrapers described in the plaintiff's patent.

The inquiry thus arises—are the curved plates described in Wheeler's patent, substantially the same in their structure and operation as the scrapers of the Varney patent, and if so, do the latter constitute a "material and substantial part of the things patented by Varney, definably distinguishable from the other part." To determine this question, a brief description of Wheeler's machine is necessary.

The Judge then describes the Wheeler pan and the Varney pan and scrapers, and says:

In the Wheeler pan four plates are used while Varney employs only two scrapers. The form or curve given to these plates in both machines is similar, though not identical; but in their structure, arrangement, and the use for which they are intended, there is an essential difference. The scrapers of Varney are represented as of inconsiderable width, and extending from a ring at the center to the periphery of the muller—they rest apparently upon the surface of the muller, and no means of elevating or depressing them are mentioned in the specifications or exhibited in the drawings.

The plates of Wheeler are of considerable width, and attached to a frame suspended from the top of the shaft, resting upon a vertical screw, by means of which the frame and plates attached to it may be elevated or depressed. The plates extend to the inner surface of the pan, where they are secured by slides. The office of these plates, as described in Wheeler's patent, has already been mentioned. It appears to me that the scrapers of Varney neither serve, nor were intended to serve, any such purpose. [Here the Judge gives his reasons for the above opinion.]

For these reasons I am of opinion that the curved plates of Wheeler differ from the scrapers of Varney in their form and arrangement, their object and effect, and that therefore their use is not an infringement of Varney's patent.

Much testimony was taken to show that in fact Wheeler's invention was prior to that of Varney's and that the latter derived his ideas from the former.

It is claimed by Varney that his invention was, in its essential features, matured and perfected in August, 1861. But this statement seems hardly consistent with his declarations or his conduct.

Varney's application for his first patent was not made until the end of October, 1861. That machine has since been discarded as useless.

If then, at the time of this application, he had already matured and perfected the invention of another and far better machine, he committed a practical fraud upon the public in withholding from them the benefit of his skill and ingenuity. It is certainly strange that he should have gone to the trouble and expense of procuring a patent for his first machine, and delayed, for nearly a year, his application for a patent for the improved machine which he had, as he says, already invented.

It may well be doubted whether, if it be true as Varney states, that at the time of his application for his first patent he had already completed and perfected his improved machine, the suppression would not be fatal to both. It appears in evidence that, so early as December, 1861, Wheeler had conceived and communicated to Stewart & Kirkpatrick at Washoe, the idea of his machine. He explained to them the mode in which the circulation, or over and under current was to be produced, and the guide boards by which it was to be assisted.

In January, 1862, drawings of this machine were received at the Miner's foundry, and Stewart, the partner of Churchill, was desirous of having his pans constructed on that plan. The theory and construction of the proposed pan were fully explained to Varney, who succeeded, however, by affecting to consider Wheeler's pan a "humbug," in dissuading the parties from adopting it, and in inducing them to order pans made on the model of his own patent. These were subsequently discarded as useless. We are driven to adopt one of two suppositions: either that Varney wilfully deceived Stewart in inducing him to order an inferior pan, or else that he had not at that time discovered the mode of producing the over and under current, recognized its utility and invented a machine to effect it.

Wheeler commenced manufacturing his machines in January, 1862. He commenced using them in June of the same year. They were constructed at the Miners' Foundry by the defendants to this cause, under the immediate observation of Varney. But in his conversation with Scott, in July, 1862, and in his communications with the defendants, he does not appear to have intimated that he was the first inventor of the Wheeler machine, and that in constructing the latter they were violating his rights. Up to the end of 1862, he continued to have his own pans built at the same foundry; and it he really considered the construction of Wheeler's pans to be an infringement of his own invention, his silence is inexplicable. His delay in applying for his second patent is equally unaccountable. In August, 1861, he had, as he says, completed and perfected his invention of his improved machine, and yet in October of that year he applies for a patent for his first and imperfect invention, and delays his application for a patent for his improved and perfected machine until the end of June, 1862—more than a month after Wheeler had taken the preliminary steps to obtain his patent.

It is unnecessary, however, to pursue this inquiry further, for in the view I have taken of the case the question of priority of invention is immaterial.

The Judge then notices the other grounds of defence, and says:

If this view of the effect of that statute be correct, it affords a defence to Wheeler as well as the other defendants. It is not pretended that he has used any machines not manufactured by them, or that he has infringed the plaintiff's rights, otherwise than by receiving from the other defendants the sum agreed to be paid by them on the sale of his machines.

I find, therefore, for the defendants.

[In this candid statement to the public, I should have preferred to have given the decision of the Judge and the findings of the Court in full, but for the great length of space they would occupy; and I will state that the same can be found in the "Mining and Scientific Press," of December 10th and 31st, 1864, and invite their thorough perusal.]

It will be seen by the above statements that Mr. Varney is infringing on my patent right by the use of wide guide plates in his pans, instead of my infringing on his patent. The truth is, he never used any but narrow scrapers in his pans until after I had put my pans in operation, and they had proved a success. None of his pans made prior to the year 1863 ever run six weeks without being condemned and thrown aside. This may account for the fact that he afterwards altered his patterns and made them like mine, with an open, deep pan, and wide guide plates instead of scrapers, and put a wooden cover on the pans.

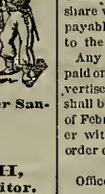
Having established my right in my patent Amalgamator, it is now my turn to protect myself against the infringement of "Mr. Varney, or any other man," and I intend to do it; and all persons are hereby warned not to purchase or use machines called "Varney's Amalgamators," as made at the Union Foundry, Pacific Foundry, or any other place, as they will make themselves liable for an infringement on my patent right.

Having made some important improvements in my Amalgamators, the public are invited to call and examine them at the Miners' Foundry, San Francisco, or at Prescott & Schiedel's Foundry, Marysville, where they are manufactured. ZENAS WHEELER.

San Francisco, Dec. 27th, 1864.

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alteration, which they may desire, made in their advertisements, at their earliest convenience. New advertisements should be sent in as early as possible.

DEWEY & CO., Publishers.
Office, 11 Government House, corner Washington and Sansome streets, San Francisco.



Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the MINING AND SCIENTIFIC PRESS. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

NEW PENSION, BOUNTY AND BACK PAY AGENCY.

The Proprietors of the MINING AND SCIENTIFIC PRESS have established an Agency for prosecuting claims against the United States Government for Pensions, Bounty, and Back Pay.

Discharged Soldiers, and heirs of Deceased Soldiers, will find it for their interest to call upon us for any information relating to the above, as our facilities for preparing the proper evidence, and for collecting claims, are such as will invariably secure prompt returns.

Room No. 11 Government House, Corner Sansome and Washington Streets,
San Francisco.
Office of the Mining and Scientific Press.

Bids for Contract.

Bids for contract to take out from Fifty to One Hundred Tons of Ore, from the claim of the ROSE GOLD MINING COMPANY, in Gentry's Gulch, Mariposa County, will be received. Said ore to be taken from a shaft on the claim, and from a level of eighty feet below the surface. Inquire of or address **A. BUETELL,** Secretary.
Office, No. 624 Market street San Francisco. 25-4

Mining Notices—Continued.

Bella Vista Gold and Silver Mining Company, Cacachillas District, Lower California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 11th day of November, 1864, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
R S Edgecomb	64 65 66	18	$11 70
John Shirley	134 135 136 137 138 139	54	35 10
J B Lynde	148	18	11 70
H L Chamberlain	125	36	23 40
J P Molt	45 116 47	18	11 70
Godfrey Haigitt	169	10	6 50
W A Daua	75 76 77 78 77	144	93 60

And in accordance with law and an order of the Board of Trustees, made on the 11th day of November, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on the 31st day of December, 1864, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

J. FULLER, Secretary.
Office, No. 326 Clay street, San Francisco. [dec17-21

POSTPONEMENT.—The above sale is hereby postponed until Saturday, January 14th, 1865. By order of the Board of Trustees.

J. FULLER, Secretary.

Bay State Gold and Silver Mining Company, Turnback District, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 12th day of December, 1864, an assessment of 50 cents per share was levied upon the capital stock of said company, payable on the 15th day of December, 1864, in United States gold and silver coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on Saturday, the 14th day of January, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 28th day of January, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. F. HARRIS, Secretary.
Office, S. E. Corner of Second and Howard streets, San Francisco. dec17-25-4

Notice.

All those having claims against the Citizen's Coal Mining Company, Mount Diablo District, Contra Costa County, California, are requested to send in their claims or bills on or before the 7th day of January, 1865, to the Secretary, as none will be accepted after that date, the company being in liquidation, and ready to dissolve on or about that date. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary
Office, Corner Post and Dupont street, San Francisco.

Comstock Gold, Silver and Copper Mining Company, San Antonio District, Lower California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 10th day of December, 1864, an assessment of $2.50 per share was levied upon the capital stock of said company, payable immediately in United States gold and silver coin, to the Secretary, at room No. 9, Mercantile Library Building, San Francisco.

Any Stock upon which said Assessment shall remain unpaid on Saturday, the 14th day of January, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 28th day of January, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

And in accordance with law, and an order of the Board of Trustees, made on the 25th day of November, 1864, so many shares of each parcel of said Stock as may be necessary, will be sold at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on the 26th day of January, 1865, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

RALPH EMERSON, Secretary.

Office, Room 5, No. 540 Clay Street, San Francisco. 27

George Washington Gold and Silver Mining Company, Silver Mountain, California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 12th day of December, 1864, an assessment (No. 3) of 50 cents per share was levied upon the capital stock of said company, for the months of December and January, payable immediately to the Secretary, or to S. A. HAWKINS, Superintendent, at Silver Mountain.

Any stock upon which said assessment shall remain unpaid on Saturday, the 21st day of January, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 4th day of February, 1865, at the office of the company.

Assessment No. 4 of 50 cents per share, for the months of February and March, 1865, due and payable as above on the 13th day of February, 1865. Any stock upon which said assessment shall remain unpaid on the 11th day of March, 1865, will be advertised on that day as delinquent, and sold on the 25th day of March, 1865, at the office of the company. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.

Office, No. 430 Montgomery street, San Francisco. 25

Gobernadorn Silver Mining Company, San Antonio District, Lower California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 17th day of December, 1864, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable on the 24th day of December, 1864, in United States gold coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on Saturday, the 21st day of January, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday the 4th day of February, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

C. W. HAYDEN, Secretary.

Office, No. 522 Montgomery street, San Francisco. dc24-26-4

Hudson River Copper Mining Company, O'Possum Bar District, Amador County, California.

The Annual Meeting of the Stockholders of the above Company, for the election of Trustees for the ensuing year, will be held on Thursday, January 12th, 1865, at 11 o'clock A. M., at the office of the Secretary, No. 728 Montgomery street, San Francisco. N. G. FRENCH, Secretary.

26-3

La Libertad Gold and Silver Mining Company, Cacachilhas District, Lower California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 13th day of December, 1864, an assessment of 25 cents per share was levied upon the Capital Stock of said Company, payable on the 14th day of December, 1864, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the Saturday the 14th day of January, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 28th day of January, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

WILLIAM VALE, Secretary.

Office, No. 36 Exchange Building, N. W. corner of Montgomery and Washington streets, San Francisco. dec17-25-4

Mosquito Quartz Mining Company, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of December, 1864, an assessment of five dollars per share (one dollar per foot) was levied upon the capital stock of said Company, payable on the 20th day of December, 1864, in United States gold and silver coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on Saturday, the 21st day of January, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 6th day of February, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

G. PARDOW, Secretary.

Office, No. 15 Montgomery Block, San Francisco. dec24-26-4

Mammoth Gold and Silver Mining Company, Rock Spring District, San Bernardino County, California.

THE MINING AND SCIENTIFIC PRESS is now in its Tenth Volume. Its circulation has more than doubled during the past year. It contains 16 pages and 64 columns, and is not surpassed in value by any weekly journal on the Pacific Coast.

ALLCOCK'S POROUS PLASTERS RELIEVING AND PAIN STRENGTHENING

In Local Affections no words can give a just idea of the comfort one of these plasters impart. They are the plaster of the day, and a fit type of our present advancement in science and art. In Asthma, Cough, Kidney Affections, and local deep-seated pains, they afford permanent relief. TRY ONE, and be convinced.

TO MINE OWNERS.

REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Address **J. MOSHEIMER,**
Office, Nos. 14 & 15 Mead's Building, Corner of Pine and Montgomery Streets, San Francisco. 9v23tf

BRANDRETH'S PILLS.

This Medicine often Cures when all others have failed. They prevent Apoplexy; they Cure Diseases of the Heart and Nervous Diseases, and as a
Purgative and Bilious Pill,
They have not their equal in the World.
Employed according to directions, accompanying every box of new style, they produce
Great Purity of the Blood and the System Generally,
Causing only the removal of vitiated matters which have become useless or injurious, and securing in their reconstruction of diseased parts of nothing but sound and healthy materials.
THE USE OF BRANDRETH'S PILLS
OCCASION
The Actual Decrease of the PRINCIPLE OF DEATH, and an Increase of the Vivifying, the Life Principle.

B. BRANDRETH,
204 Canal Street, New York.

W. F. BRANDRETH,
Office at Crane & Brigham's, San Francisco.

By sending $1 in coin to the above address, five boxes of pills will be sent to any part of this coast or the interior. Free of charge. 16-3m4c8p

MINING LAWS AND FORMS.
Third Edition revised and enlarged.
Compiled by H. B. CONGDON.

THE BEATER PRESS.

At Treadwell's hardware store, corner of California und Battery streets, in this city, may be seen a *slice*, or section, which has been *sawed* from a bale of straw hay, baled by the new "Beater Press," a representatinn of which is hereto annexed. The hay is so closely pressed that the saw in passing through it leaves a smooth, clear surface, which is so hard and firm that letters or words may be engraved upon it with a knife, as upon a soft wooden surface. One of the presses which has accomplished this work may be secu in operation on Mission street, between Beale and Main streets. It is a recent invention, and has been designated a *beater* press from the peculiarity of its operation.

The working of this press is very simple. By means of a horse-power, a heavy weight (1,200 to 1,500 pounds) is lifted to the top of the machine (15 feet), by a rope passing from the top the horse-power over the wheel at the top, and thence falls upon the hay, which is thrown, one or two forksful at a time, into a strong box. This effectually takes the "spring" out of the hay, and when a sufficient quantity has been put in, the horses are turned and driven in the opposite directiou, when, by means of a pair of powerful screws, operating upon the beater as a follower, a pressure of 300 tons, as we are told, is brought to bear upon the hay, which easily takes the position into which the blows of the beater pressed it. It is then bound with hoops, or wires, and possessing a lower degree of elasticity than other pressed hay, the hoops are less liable to burst. The bales contain from 400 to 500 pounds of bay, and measure about 3 feet 9 inches long by 22 inches wide and deep; they are very square edged, and pack like bricks; they do aot seem likely to burn, and are but to a very slight degree penetrnble by water. Hay or straw in such bales is as good freight as flour on railroads and vessels. The aunexed cut sbows the box above the mould, into which the hay is tbrown; the mould represented open, containing a bale of hay, and one of the screws on the side of the box and mould, by which the final pressure is applied.

We were shown, while examining the press on Mission street, several bales of hay and cotton, which have been put up by this machine. Three bales of hay, pressed as they ordinarily are for this market, are by this machine pressed into the compass of one bale of the same size. The application of the beating principle is very wide. The pressing of cotton, hemp, wool, oakum, hops, rags, etc., are at once suggested. The beater press is quite portable, and can be easily taken from place to place in a two-horse wagon.

These machines are coming into very general use in the Atlantic States. Wherever bulky articles of a compressible nature are to be transported by railroad, steam, or sailing vessels, this machine will save fully half the freight, besides securing a much greater immunity from danger by fire, or moisture from absorption. Many of the railroad companies at the East are refusing to transport hay, except in box cars, on account of danger from fire—a rule which effectually excludes that article baled in the ordinary manner, on account of its bulky nature. All hay now purchased at the East by Government, for transportntion, is required to be baled by the "Beater Press."

There is very great room to believe that this invention will yet exert au important influence upon the general agricultural interests of this country, particularly in the production of hay—a crop which, even previous to the war, exceeded in value by more than double the heaviest cottou crop produced in the country. By the use of this machine it is claimed that hay will soon become an important article of export. Our farmers can raise bay cheaper than it can be produced in any other country on the globe. A large amount of shipping is now compelled to leave our Eastern, as well as California ports, in ballast, for localities where hay commands a price which will pay for its shipment when put up in so compact a manner as is done by the Beater Press.

Its value to California, in this respect, may yet be found an important interest, to say nothing of its importance to the prospective and even present cottou and wool productions of the Pacific coast.

A company has been organized in this State, to be known as the "Pacific Beater Press Company," which have secured from the patentees the exclusive right for the use and manufacture of this press on the Pacific coast. Their advertisement will be found in another column. We give our readers the facts and statements presented to us in connection with this very interesting and certainly important invention, which seems likely to exert a marked influence upon the agricultural interests of the country.

A Special Contract Law has passed the Nevada Legislature, and become a law, by the signature of the Governor.

Sanitary.—The sum of $67,000 in coin and $7,000 in currency has been forwarded to the United States Sanitary Commission, New York, from California, since September 1, 1864.

A man who visited Pacheco Pass, on Mt. Diablo range of mountains, recently, says that among 8,000 sheep, he could not find a single one fit to kill.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Problem of Gold and Silver Extraction---A General Review.

BY PROF. L. LANSZWEERT.

Gold, which has hitherto been found either pure or alloyed with other metals, usually occurs disseminated or distributed in minute quantities in the parent rock, which is generally either quartz, or at least very quartzose. The metal is, however, by no means confined to this substance, being found also in clay, slate and limestone, as well as with granite and various other igneous and metamorphic rocks. It is usually associated with iron, often in the form of pyrites, sometimes with silver, tellurium, platinum, and occasionally with rarer metals, such as palladium, osmium, iridium, and rhodium, which are chiefly interesting as mineralogical curiosities. Other minerals associated with gold, are copper pyrites, blende, galena and sulphur. Gold *invariably* exhibits something of the peculiar yellow color which it is known to possess in a pure state; but this color is modified by various metals with which it may be alloyed. Thus it may be described as having various shades of "gold-yellow," occasionally approaching silver-white, occasionally resembling brass-yellow, of every degree of intensity, and even verging to steel-gray in some specimens from South America. The form in which gold is found is various. It is sometimes crystalline, in eight or twelve sided regular figures, passing into cubes; but the crystals are generally small and rare. In case of such crystals being found, it is well worth knowing that they possess value, as mineral specimens, far beyond that of their intrinsic worth as gold. More frequently this metal is found in lumps or grains, called by the Spaniards "*pepitas*," and by the Mexicans "*chispas*," varying in size from that of a pin-head to masses weighing nearly 100 lbs. Troy. The term "*pepita*" is only applied to grains of some magnitude, and the most common limits of size are from that of a small pin-head to that of a nut or gooseberry. When much smaller, and still rounded, they are called "dust," and, when flattened, "scales," or "spangles." In nature, and when seen in veins of quartz, gold often occurs "foliated," or in leafy expansions of extreme thinness, or in branchy, "dendritic" forms, probably made up of minute crystals. It is in the form of very minute grains that gold is generally disseminated through rocks, and auriferous ores of various metals, and these are reduced, according to circumstances, in methods that will be alluded to hereafter. In *pepitas* and small grains it is carried down by streams, and deposited in their beds, the *pepitas* being usually most abundant where there is reason to suppose considerable disintegration of the surface, and where the action of denuding causes to a great extent is evident.

In many locations in California, especially on river banks, or bars, these grains are almost of a uniform size, small, thin and roundish, very much of the shape of small fish scales (scale gold). In other cases, they are more thick and plump, sometimes approaching the form of melon seeds, or beans (shot gold). But most commonly they are irregularly rough, with all sorts of holes, wrinkles and creases on their surface, which are often filled with earthy particles, clay, small bits of quartz, and the like. Sometimes the grains are partly or entirely covered with oxyds, imparting to them, in many cases, a false and deceptive coloring. In other places—as in the southern district of our mines, on the rivers Fresno and Chowcilla—gold frequently occurs in elongated *fiber* or *needle-shaped* grains, owing, probably, to some previous admixture of lead. By the beautiful appearance and seemingly very rich color of this sort of dust, many an unlucky gold-dealer has come to harm, this being one of the coarsest kinds of gold in this State, on account of the great proportion of silver it contains.

A remarkable mixture or alloy of native gold and silver is occasionally found, especially in Siberia, known under the name of "*electrum*," or "*zoroche*," by the Mexicans. Its color is pale, brass-yellow, passing into silver-white. It occurs in small plates and imperfect cubes, and possesses many of the characteristics of pure gold, but consists of only 64 per cent. of that metal and 34 per cent. of silver; its specific gravity does not exceed 12. Other alloys of gold are: a rhodium gold, found in Mexico, and containing 34 to 43 per cent. of rhodium, having a specific gravity of 15 to 16.8, and a clear, dirty yellow color; a palladium gold, containing 9.85 per cent. palladium and 4.17 per cent. silver, found in Brazil and elsewhere in South America, in small crystalline grains, of pale yellow color, especially in Transylvania. Auriferous ores of tellurium, including silver, have been found lately in Amador and Calaveras counties, in this State. Their color is steel-gray, and they tarnish on exposure. The variety called graphic gold, or graphic tellurium, consists of about 60 per cent. tellurium, 30 per cent. gold, 10 per cent. silver, and is worked chiefly as an ore of gold. Another variety—"yellow gold glance"—yields somewhat less tellurium, gold and silver, and as much as 20 per cent. of lead. Platinum, iridium and osmium occur, in considerable proportion, associated or alloyed with gold, principally in the Northern mines, above Shasta, but most strikingly in the auriferous deposits on the Northern coast, between Humboldt Bay and the Columbia river, where not less than one-third of the precious metals worked out of the sand beach consists of an average of the above mentioned metallic combination, of which, again, about one-third consists of platinum. The beach just mentioned being continually exposed to the action of the tide of the Pacific Ocean, abounds in vast deposits and layers of black sand, in which the roundish, flat spangles of gold and iridio-platinum are imbedded.

Pettenrofer's discovery of platinum in both gold and silver is of some importance, for it serves to explain, in part, the refining effects of nitre on gold. By this fusion an appreciable quantity of gold is taken up by the nitre at the same time, although gold alone is slightly affected by it. After treating with water the slags resulting from toughening gold by nitre, the fine gray sediment contains alumina, silicic acid, potassia, oxyd of iron, copper, lead, platinum gold and metallic gold.

Palladium and platinum gold, not unfrequently present in California gold, are likewise removed by nitric acid in parting silver from gold. Grains of iridosmin have been observed in California gold, in distinct particles, even after three or four fusions, and seem to have no tendency whatever to enter into an alloy; but while casting such gold, these particles collect at the bottom of the crucible, from their greater specific gravity, and re-melting in a small crucible, and carefully casting, they may be obtained mixed with a small quantity of gold—the latter dissolved by nitro-muriatic acid, and the iridosmin obtained pure.

Gold, as is admitted by all metallurgists and most practical miners, is never found in nature as an *ore*, but exists in the metallic state, mechanically intermingled with foreign substances—a rule which holds good even when chemically combined, as in the graphic ore of Nagyag. Although admitting that the gold found generally, in nature, when associated with other metals, exists in the metallic condition, this state has somewhat modified its nature, that certainly there must be some peculiar or indefinite combination in these alloys. The term alloy, in its most general acceptation, means the mutual combination of two or more metals. When one of the metals, however, entering into combination is mercury, the result is not usually termed an alloy, but an *amalgam*. All ores are practically interesting to the metallurgist in two ways; either the metals to which a metallurgic process of extraction is applied are found in the condition of native alloy—*i. e.*, one naturally existing—or an alloy results as the consequence of an intermediate metallurgic process. The intermediate combination of lead and silver, resulting from the metallurgic process of reducing galena, furnishes a good instance of this latter assertion. At the present time the belief prevails—I may even say it is universal—that alloys are not always mere mechanical mixtures of different metals, but are constituted in accordance with the laws of definite chemical combinations, being no less atomic (to adopt the language of the atomic theory) than oxyds and salts are atomic. It would lead us too far from our subject to advance the various arguments which exist in favor of this belief, and indeed a superficial glance at the bearing of the hypothesis would, perhaps, induce the practical metallurgist to pass it by as devoid of utilitarian interest. Few subjects, however, are more intimately related to the utilization of metals, than those involved in the seemingly abstract question of chemical composition, or of mere admixture, in relation to alloys.

An illustration, very much to the point, is afforded by Henry Mackintosh, who found an alloy of gold and silver which he could not get to amalgamate, after continued grinding with mercury for six months. He thought it contained about 50 per cent. of gold and 50 per cent of silver—Jonneschmidt remarks the same. He thought it was owing to the surface being covered with some foreign matter—at the same time, if this was the case, the film was so small as not to be perceptible; another illustration of the above theory is afforded by the manufacture of the alloy called "silver-steel."

In the course of some experiments performed by Professor Faraday and Mr. Stodard, they discovered that silver when fused with steel, in certain given proportions, entered into mutual combination and formed a valuable alloy. If, however, the quantity of silver was increased above a certain proportion—not yet quite ascertained—the excess of silver was exuded from the metallic mass during the process of cooling. This result at once affords testimony as to the chemical constitution of the alloy, and points to the practical advantages likely to be derived from a solution of the question, "What are the exact or atomic proportions in which steel and silver can combine?" Granting for the sake of argument, that the silver-steel be so far superior to ordinary steel, as to warrant its manufacture, the conclusion follows that it is a point of the utmost importance to determine the exact maximum amount of silver which steel can take up. Not merely would the addition of every grain of silver beyond the indicated proportion be an unnecessary expense, but such of the uncombined silver as might be locked up, mechanically, in the alloy, during the cooling process, would lessen its strength, but also impart a general deterioration of quality. The same question could be put as to gold alloy, what quantity of silver prevents gold from amalgamating?

[To be Continued.]

[Written for the Mining and Scientific Press.]

Remarks on Calvert's Supposed Improvement in Reducing Gold Ores.

BY T. ROWLANDSON, FELLOW OF THE GEOLOGICAL SOCIETY, LONDON.

The contents of a paper read by Dr. Calvert, at the last meeting of the British Association for the advancement of science, respecting what he supposed was a novelty in gold reduction, has excited an amount of attention around us, greatly beyond its intrinsic value, and in some instances has given rise to hopes which the paper itself does not justify, nor would it appear that the author contemplated. The paper alluded to, was inserted with comments in the Mining and Scientific Press of December 17th, 1864. It will, perhaps, be well before entering a critical examination of the subject, to take a brief review of the character of the association, before which the paper in question was read, and the special *status* which the reader occupies amongst scientific men, as both are important items in estimating its value. It will also form a fitting subject of inquiry, how far the experiments of Dr. Calvert coincide with what would occur with natural ores similarly treated.

No individual appreciates more the beneficial influence that has been exercised by the British Association as respects the spreading of a taste for science amongst that class of the English community, known as "well to do," than does the writer of this article. The itinerant character and social usages of the Association, have done much to elevate the position of scientific devotees, not only in England but also, by its influence throughout the civilized world, generally. Notwithstanding this, the fact that any one can obtain admission as a member on paying for the current year, the sum of $5.25, which entitles him or her (for ladies can be members also) to all the privileges of the Association, and a somewhat deficient strictness which often admits the reading papers of a not very high character, very much lowers, in general estimation, the character of its transactions, and has obtained for it the slang appellation of "Mudfogs."

Some years ago it was determined to establish at Manchester, a school for the education of pupils in chemistry, but more particularly with reference to those branches of that science which especially pertained to dyeing and calico printing. This school commenced with only limited funds and patronage, the institution consequently was unable to afford an adequate stipend to a first rate chemist as principal. I believe Dr. Grace Calvert was the first appointed; at all events he has held that position from a very early date, and I have yet to learn of any very striking original discovery made by him, even in this department of chemistry in which he ought, by his position, be presumed to be more particularly occupied and interested.

Having thus made a *resume* of the relative importance which may attach to the reader and the association before which the paper was read, I will proceed to examine the merits of the experiments detailed as compared with what would occur on a working scale, and to this the reader's attention is particularly requested; for it will be seen, even to a more than superficial observer, that much care has been bestowed in making as exact an imitation of natural condition, as it is possible to design, by one not a special expert, yet the overlooking of one or two apparently very trifling circumstances invalidates the conclusion arrived at. This fact is one that it is very desirable should be well impressed, as an example, on the minds of those into whose hands the practical direction of our mining and attendant metallurgic operators are interested, for the want of such knowledge has led to an enormous outlay of money, time and labor, in needlessly fruitless experiments which, *a priori*, by a competent expert, would be pronounced worthless. The same want of precaution may probably, in the future, cause an equally wasteful expenditure, notwithstanding at the present moment those intrusted with the management of such operations on this coast, appear to have doggedly resolved that no improvement on the existing modes adopted at Washoe, &c., &c., can be arrived at. If this opinion was based on the grounds of the improbability of any strikingly novel invention arising, I should be in a great measure inclined to agree, though not wholly so. The fact is, the failures that have arisen have been altogether owing to the incompetent theoretical or practical knowledge, and in many instances of both, of the parties intrusted with the direction of the chief metallurgic operations on this coast; and the same cause, the deficient knowledge of what has been accomplished, and consequently can be done again, and accompanied by the ability to adopt or adapt processes according to the variety of ores to be treated, are the principal reasons why the returns made by our chief mines, are so low as they are, and so costly even at that.

Professor Calvert, with the utmost fairness, attempted to imitate gold ore by the addition of 22 parts of finely precipitated gold amongst 100 parts of pure sand, the latter being intended as the representation of quartz rock, which it would be, were it not that auriferous quartz invariably contains at least one half of one per cent. of iron pyrites, sometimes accompanied with other sulphides also, and an occasional

mixture, in California ores, of tellurides and seleurides. Small as the total amount of this may be, they will be found to greatly interfere with the success of the proposed process. It may be well also to call attention to the fact that Dr. Calvert's experiments were made upon an artificial mixture, containing at the rate of 44 lbs of gold to the ton, whereas the bulk of quartz mined throughout the world does not contain more than 240 grains per ton, or only about one sixty-thousandth part of one per cent., in place of the 22 per cent. in the artificial preparation. Dr. Calvert states that he succeeded in extracting by his method *within a fraction* of the total amount of gold in the mixture, but how small that fraction was he does not state, I suspect much more than one sixty-thousandth part of the gold contained therein.

In all my experience the great loss sustained in extracting gold from quartz rock has arisen from the presence of the sulphides and other compounds noticed above, which, if concentrated, will generally be found notably rich in gold, usually from $300 to $900 and even $1,000 per ton. If pounded sufficiently, by using fine screws, gold from quartz rock devoid of pyrites, etc., may be extracted, in the batteries, by means of quicksilver, to an extent that will leave in the tailings not more than $2 per ton, a much surer exhaustive process, I suspect, than the supposed novel method proposed by Dr. Calvert.

I advisedly employ the term "supposed novel method," *because no novelty exists*. It is simply a modification of the late Professor Plattner's mode, for which the Professor obtained a medal at the International Exhibition, in 1861, and is one that would occur to the merest tyro in metallurgical chemistry, and would long ago have been adopted did not a serious practical difficulty intervene, owing to the presence of pyrites and other substances which I shall point out.

The mixture proposed by Dr. Calvert cannot be applied without producing hydro-chlorine (muriatic acid), which, on coming in contact with the sulphides present in the ore, will occasion the evolution of hydro-sulphuric acid, which possesses the property of precipitating gold from its solution, and rendering it again insoluble, thus undoing what would be effected by the chlorine evolved. There exists also some other minor practical difficulties not necessary here to repeat. I shall leave the subject with a remark as to the very operose and tedious mode recommended by Dr. Calvert, of bringing the chlorine in contact with the gold, by repeated pumpings and lixiviations; the object thus attained being merely the removal of the saturated chlorine and so presenting a fresh surface to a new supply of the solvent. The same effect could be obtained by simply *stirring the ingredients*—a feat known to every child as he stirs the sugar in his coffee.

[Written for the Mining and Scientific Press.]

A Copper Mining District in Oregon.

We read, some time ago, in the Oregon *Sentinel*, an article upon the Josephine county copper mines. We give below an extract from this article, as an introduction to what we have to say about these mines:

"The future of Josephine county seems to depend, in a great measure, upon the success of the copper mining operations which are now being carried on. That they will realize the highest anticipations of their proprietors, but few in this vicinity seem to doubt.

A small piece of pure copper was found in a sluice, here in Sailor Diggings, as early as '56. Copper was also found, about that time, on the Illinois river, near where the Full creek vein is now being worked. But there was too much gold in the country then for people to care anything about copper.

The first indications of what seemed to be a vein of copper ore were discovered by a man named Heawes, in 1859, on a hill two miles west of Waldo, in the immediate vicinity of the now celebrated Queen of Bronze lead. This mine has been for the last year in the possession and under the management of Dr. d'Heirry, a French gentleman, from San Rafael, Cal., to whom, more than any one else, our country is indebted for the development of its copper mines. In regard to the richness and inexhaustibility of this mine, there can be no question; and I presume there can be none in regard to the opportunities afforded to make it an immense profit. Dr. d'Heirry intends to erect furnaces and other works, in the vicinity of the mine, for this purpose there are vast quantities of the best wood for fuel, as near the mine as it can well stand. A short ditch from the Illinois river—only a half mile distant—will give water to run all necessary machinery. In fact, the location of the mine cannot be surpassed, and if skill and perseverance will make it "pay," the Doctor is the man to do it."

We have before heard a good deal about these Josephine county copper mines, and especially about that known as the "Queen of Bronze." Your valuable paper, the *Alta*, and others, had informed us, last year, of the marvellous *prospects* of this lead. What we read excited our curiosity, and we took advantage of the last fine days of the past Autumn to visit this new mining region. We have nothing to regret in this little excursion, which made us acquainted with a very interesting country, where your readers, and especially those who are occupied in mines, will probably be glad to accompany us. We will take a glance at the country we passed over.

Most of your readers doubtless remember the excitement caused, some years ago, by the discovery of a rich quartz ledge at Gold Hill, near Jacksonville (Oregon). This mine was nothing but an immense pocket; but we all know the wonderful quantity of gold found in it during a few months. Since that time, Jacksonville and its neighborhood has fallen again into comparative oblivion, which, however, is unjust and not merited, for the placers from this place to Sailors' Diggings, and all the surrounding streams and gulches, are paying still, and would pay much better if they were worked on a larger scale. Besides, where the Gold Hill quartz mine glittered, some time ago, there are still some quartz mines worthy of the attention of the public.

Several auriferous veins are being worked near Jacksonville, and are paying well and regularly. At Slate creek, half way from Jacksonville to the Queen of Bronze, they are working some magnificent gold-bearing quartz. At Althouse, seven miles from the copper leads, there is a very remarkable quartz vein, which pays very largely and with remarkable regularity. All these mines are worked with arastras, on account of want of capital, which here, as in California, we believe, is very vagrant. It prefers long and hazardous journeys, and hunting for wild and problematical mines, to a quiet and secure settlement near by. We know that all we may say on this subject will effect no change in this respect. Capital will continue to go so far that one day it will not be found again, and the mines of Southern Oregon, so near the San Francisco market, will be obliged to clear their way by their own means. They can do it; the mule arastra will pay for an hydraulic one, and the latter for stamps and amalgamators. So much the better; it will be more in conformity with common sense. These mines will be self-made; they will have so much the more merits, and their owners the more profit. In other respects this country has been very little prospected, in view of the extensiveness of its mines, and contains, we are convinced, considerable undeveloped wealth.

The route from Jacksonville to Waldo is very picturesque. Cut through immense forests of oaks and pines, it generally follows along the course of the streams through the mountains. One always finds there a freshness in the air, and a balsamic perfume emanating from the resinous trees, which makes respiration delightful. In such an atmosphere it seems impossible to die.

The soil is rich, and deep enough in all the wooded parts, to be cultivated with advantage, but the glades, or openings in the timber, are covered with schists and gravel. However, all this rich country of the Illinois and Rogue River Valley, is to some extent condemned to sterility; the population being insufficient to consume its superabundant productions, and there are no means of cheap transportation for exports.

But let us resume the route to the copper mines:—Sixty miles bring us from Jacksonville to Waldo. The latter is a small town situated on the road from Jacksonville to Crescent City, and distant sixty miles from the harbor of the latter place. Two miles from Waldo is the Queen of Bronze copper mine, which is reached by a fine level road, leading out from the main road at Waldo.

THE UPPER MINES OF THE PACIFIC COAST.

Before proceeding further, it may be proper to give a short topographical and geological sketch of the copper mines of the Pacific coast. We all know that the Sierra Nevada, a western branch of the Andes, stop not far from the northern boundary of California, or, to speak more plainly, is divided into several branches which run through Oregon and Idaho, and there take different names. The Siskiyou Mountains are the most western branch of this great division. Now the Queen of Bronze being situated on a spur of this range, (Siskiyou) is therefore on the most western slope of the great range of mountains running from Patagonia to Behrings Staits.

It is well known that a vast copper region seems to run from south to north on or near the western slope of this great range, sometimes sinking to an immense depth, and again being completely lost to appearances, always, however, reappearing at some distance with the same, or nearly, the same geological characteristics, and giving nearly the same ores.

Several formations of copper veins seem to exist in this immense extent of land, thus, in Chili and in Peru, we find a first line of copper mines, the most western, between the Cordilleras of the coast and the Andes, yielding pure copper pyrites, viz: copper pyrites free from gold, silver, antimony, arsenic, &c. This first region is found among the diorites, porphyries, sienites and other eruptive rocks. Further to the east, and consequently nearer to the Andes, are found the copper ores containing silver, and contaminated by arsenic and antimony.

We find again, these deposits of copper in New Granada and Mexico, in about the same condition and in the same formations, or in the same metamorphic rocks passing from one to the other. Geological and topographical conditions about the same, appear to be found in California, Nevada and Oregon. There, wherever copper ore exists, we find two deposits, one of ores containing silver, arsenic and antimony, and one of pure copper pyrites.

If now we follow this line of pure copper pyrites, always on the western slope of the great range of mountains, from Mexico, for instance, running N. or N. N. W. we find it at Soledad thirty miles east of Los Angeles, when it runs through the counties of Mariposa, Calaveras, El Dorado, Placer, Nevada, Yuba, Butte, Shasta and Siskiyou, twenty-five miles west of Yreka it enters Oregon, where it follows a northern spur of the Siskiyou mountains, and is seen at the Queen of Bronze, whence it continues its course to Fall Creek, eighteen miles N. N. W. from the Queen of Bronze, and between Fall Creek and Rogue River, a distance of fourteen miles, it is found twice in very fine out-croppings.

The preceeding observations appear to have much force. They have been suggested by Dr. D'Heirry, to whom we should give all the honor of originating the idea. This mineralogist has exhibited to us the result of much labor and minute researches in some charts, pricked with explanations and annotations, which are to be published. They appear to throw a new light on the connection of the metallic ledges of the great chains of the mountains of the American Continent. What we have just said of the great deposits of copper of the western slope of these mountains, is shown on these charts with a truth which leaves little room for controversy. It must be understood, however, that we do not expect to prove that there will necessarily be found mines of copper on all the lines above marked out.

[Concluded next week.]

SPAIN is borrowing money at the rate of fourteen per cent. per annum to carry out her unholy schemes against the independence of St. Domingo and Peru.

La Favorita Mining Company.

We make the following extracts from the report of the Trustees, at their second annual meeting, January 3d, 1865:

This Company was organized June 25th, 1863, to develop "La Favorita" mine in Sonora, Mexico, some 200 miles east of Guaymas. The capital stock is divided into 2,400 shares, of $100 each, of which 1,400 are assessable and 1,000 unassessable. Of the latter, 800 are owned by the discoverers and 200 by the Company, who have lately offered these 200 unassessable shares to parties in New York at $100 currency, and in London at £8 sterling, per share, and as soon as their negotiation shall have been effected, no more assessments will be required.

Work was begun in December, 1863. The first product was 38 bars (1¼ tons) of pure copper, reduced by Superintendent Thielebien, at the Company's works. Three and a-half tons concentrated ore, and 1,500 pounds crude ores (gold, silver and copper), were shipped to England in July last. A small lot of crude ores arrived here in August, and work was resumed on the 12th of October, with 20 men, in three shafts and two drifts. Of the ores taken out since then, 8½ tons reached us last month. The two latter shipments have been sent to Swansea, and the following advances were obtained thereon: first shipment, $1,500; 2d do., $300; 3d do., $800; total, $2,600. The difference between the sums advanced and the proceeds realized from their sale will be paid as soon as such sale shall have been ascertained. The complement of men at the mine has been increased last month to 40, and double their number can and will be profitably employed this or next month, if our finances will permit such increase.

Supt. Thielebien died suddenly on the 16th of June, and Carlos E. Seele was appointed his successor.

The shipment of crude ores having now convinced all the stockholders of the value of the mine, and freight being too high to continue them, the Superintendent has been instructed to concentrate ores by smelting, which will materially augment our profits by decreasing the cost of transportation.

The mine yields now, monthly, over 25 tons of first-class ore (valued at about $225 per ton), which quantity is constantly increasing, and nothing is required to insure a speedy beginning to an uninterrupted series of dividends save the means of earning our own transportation, which end to accomplish we deem it our duty to endorse the recommendation of the Superintendent in regard to the purchase, at the earliest convenience, of about fifty mules, with pack-saddles. They would pay their own cost in less than eight trips, besides the immense saving of freight. The cost of their sustenance would be amply covered by return freights.

Signed by the Trustees: E. T. Anthony, A. Hildebrand, E. J. Pfeiffer, M. Fenstermacher.

We are pleased to see that even printed reports of mining companies are becoming more frequent, and that the time is approaching when custom will demand their more extended circulation by being properly inserted in a reliable mining journal.

Good Hope Gold & Silver Mining Company.

The Trustees of this company, which is located in the Alpine mining district, Alpine County, have submitted the following as their report for 1864:—

Work on the mine was commenced in March last, since which time a shaft has been sunk thirty-two feet deep, and a tunnel run two hundred and twenty-six feet long, and 4½ by 6½ feet in the clear. A shed has been built over the shaft, and a blacksmith shop at the mouth of the tunnel. We have labored under great inconvenience from want of funds, but have persevered through the severest times the country has ever seen, and have finally reached a promising ledge about four feet wide.

STATEMENT.

The Company has bought at sundry sales	1,389½ shares
The Company has sold to sundries	1,179 shares
Leaving a balance to the credit of Company of	210½ shares
Am't of cash received from Assessments	$2,203 69
Am't of cash received from sales of Stock	$1,371 75
Total cash receipts	$3,575 44
Am't of cash paid on Contracts	$1,160 50
" " for day labor	978 25
" " Advertising and Printing	278 00
" " Superintending Works	514 00
" " Salary of Secretary	260 00
" " Blacksmith and Mining tools	81 75
" " Powder, Fuse and Candles	65 37
" " Working rock and expenses on same	51 00
" " Selling delinquent stock	35 50
" " Tract of Timber land—80 acres	32 50
" " Sundry fire assays	28 50
" " Lumber for the Mine	13 00
" " Supplies for the Secy. Supt. & Treas.	24 15
" " Repairs on Mining tools	13 00
" " Telegraphing and Expressing	13 35
" " Sundries, Supplies for Mine	31 56
Total Disbursements	$3,575 44
The present indebtedness of the Company is	$ 141 75

PRESTON MORRIS, Secretary.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, JAN. 14, 1865.

The share market has been characterized by a fair degree of animation this week. Leading stocks were actively dealt in without much variation in price and appear to have attained a degree of steadiness not seen for months past. Little or no change has taken place lately in the general features of most claims upon the Comstock, and we can discern no abatement of confidence in their future productiveness.

Stocks of less certain value have also been active the past few days, and large sales were made at fluctuating rates.

The money market continues easy, and capital seems more abundant than ever. The rates upon first class securities are 1¼@1½ per cent. per month.

Receipts of Treasure from the interior since last Saturday amounted to some $1,200,000. Bullion was in light supply for yesterday's steamer, and gold bars advanced to 850. Silver was unchanged and ruled at 1 per cent. premium to 2 per cent. discount.

The total receipts of gold and silver in San Francisco during the past year, through public channels (including coin), amounted to $55,000,000, as against $52,000,000 the previous year.

The product of the precious metals on the Pacific coast for the year 1864, (if an allowance of say 15 per cent. be made for receipts by private hands,) will reach an aggregate of some $56,000,000. This is nearly $4,000,000 in excess of the year 1863. The North coast has sent us $10,000,000, including $1,750,000 from British Columbia.

Nevada produced within a fraction of $16,000,000 from the following localities, as against $12,400,000 during 1863 :

Virginia City	$10,425,350	Carson	$1,994,884
Gold Hill	1,402,396	Silver City	229,000
Aurora	960,000	Dayton	220,000
Humboldt	90,000	Reese River	500,000

The following figures may serve to show in some degree the currency movement of the past three years, and perhaps give some idea of the amount of coin in circulation in the hands of the people :

	1862.	1863.	1864.
Coin remitted to the interior	$12,498,548	$12,916,781	$10,800,920
Coin received from interior	5,593,421	6,383,974	5,743,399
Balance added to interior circulation	$6,905,127	$6,532,807	$5,057,527
Total			$18,495,461

The total coinage of the Branch Mint in this city, for the year 1864, amounted to $16,323,000.

Legal Tender Notes have been less active, and $81,000 were sold, declining from 46¼ to 45¼, rallying to 46, and closing at 46⅛. Latest telegraphic advices from New York quote gold at about 218.

City stocks are in good request. Spring Valley Water Co. advanced from 75 to 80 ₱ cent on amount paid in, and is now inquired for at the latter figure. An assessment of $30 per share was levied on the 11th inst. San Francisco City Water Co. is offered at 72½; State Telegraph has risen to 33 bid, 38 asked, and San Francisco Gas is in favor at 80 bid.

Savage is in rather less request, declining from $1,655 to $1,600 per foot, at which rates 17 feet were sold. At the close, $1,600 is asked. This mine is looking as well as ever, and is producing the usual amount of ore—about 175 tons daily.

Gould & Curry has been steadily maintained, advancing from $1,480 to $1,510, buyer 30, receding to $1,480, rallying to $1,490, and selling yesterday at $1,500. In all, 19 feet were dealt in. The receipts of bullion for the month will average some $8,000 per day. Everything is said to be progressing very satisfactorily at the mine and mill.

Chollar has been unusually active, and 52 feet changed hands, opening at $1,020, advancing to $1,040, dropping to $1,010, then selling at $1,000 (ex-dividend of $40 per foot, paid on Tuesday), rallying to $1,030, buyer 30, and closing at $1,015. The lode in the south mine still holds out in length and width, and promises to become one of the largest deposits of ore yet found on the Comstock. The fifth level in the north mine is also improving, and considerable ore is being hoisted at this point. The product for the week amounts to some 2,000 lbs. of bullion (about $55,000).

Yellow Jacket is attracting more attention, and 28 feet were sold, advancing from $785 to $820, buyer 30, and closing at $850. A body of rich black sulphuret ore has been found recently, which is said to extend some distance both north and south from the main shaft.

Potosi is also in rather more favor, and advanced from $650 to $700. The suit of this Company with the Bajazet has been pending before Judge Mesick and a jury all the week, and a conclusion may be reached to-day. The Company has some 2,000 tons of ore on hand, worth, probably, $80,000.

Empire Mill & Mining Co. receded from $500, buyer 30, to $470 cash, and is now offered at $490. The yield of bullion is said to be up to the average of the past few months.

Ophir has been largely dealt in, without material variation in prices, advancing from $295 to $312½, buyer 30, receding to about $300 cash, and closing at $320 bid. Within this range 44 feet were sold.

Hale & Norcross continues depressed, and 44 feet were sold, receding from $260 to $200, and rallying to $220. We can learn of nothing new from this claim.

Uncle Sam has been very active, and 80 feet changed hands, receding from $200 to $175, advancing to $185, dropping to $175, again rising to $185, and selling yesterday at $180.

Overman was sold at $100 to the extent of 15 feet.

Imperial was largely dealt in, but has been well maintained, declining from $122 to $117, advancing to $125, buyer 30, and closing at $122 bid. Within this range 411 shares were sold.

Nevada (J. G.) was sold at $35, and is now held at $35. Antelope was dealt in at $30, and North American at $8.

Burning Moscow has continued to be a speculative feature of the market and 4,450 shares were sold, declining from $22 to $18, rallying to $22½, dropping to $18, then advancing steadily to $27 and $29, buyer 30, and selling yesterday at from $25½ to $27½. An assessment of $5 per share was levied January 9th.

Bullion has attracted more attention, and 802 shares were sold, advancing from $116 to $125 buyer 30, receding to $100, rallying to $106, then dropping to $95, again rising to $100, selling yesterday morning at $93, and closing at $90. Some painful rumors are in circulation touching the administration of one of the officers of this company, but in the absence of reliable information we forbear to mention them.

Bajazet and Golden Era has been dealt in to the extent of 445 shares within a range of $26½ and $35, closing at $32½ bid.

Wide West was sold at $13½ and $14; Daney at from $12½ to $14½; De Soto at $4 and $6; Golden Age and Empire at $9 and $10½, and Lady Bryan at $7½@$8.

The aggregate sales of Stocks and Legal Tender Notes since Saturday last, inclusive, amounted to $515,361.50.

Authorized Scale of Commissions Adopted by the S. F. Stock and Exchange Board.

Miscellaneous.

Funded Debt, on par	½ per cent
Insurance Stocks, on par	½ per cent
Wharf Stocks, on par	½ per cent
Gas Stocks, on par	½ per cent
Railroad Stocks, on par	½ per cent
Steamboat Co. stocks, on par	½ per cent
Telegraph Co. Stocks, on par	½ per cent
Water Co. Stocks, on par	½ per cent
Legal Tender Notes and Bonds, on par	½ per cent
Bills of Exchange, on net amount	½ per cent
Mint Certificates, on net amount	½ per cent
Specie, on net amount	½ per cent

Commissions on Mining Shares.

Sale at 1 dollar up to 10 dollars	$0 25 per foot
Sale at 10 dollars up to 25 dollars	60 per foot
Sale at 25 dollars up to 50 dollars	1 00 per foot
Sale at 50 dollars up to 100 dollars	1 50 per foot
Sale at 100 dollars up to 200 dollars	2 50 per foot
Sale at 200 dollars up to 400 dollars	5 00 per foot
Sale at 400 dollars up to 600 dollars	6 00 per foot
Sale at 600 dollars up to 800 dollars	7 50 per foot

From $800 to $3,000 per foot, one per cent. on the amount of purchase or sale.

Anything above $3,000 per foot, three-quarters of one per cent. on the amount of purchase or sale.

FRANK LAWTON, Secretary.

Mechanical.

How to Calculate the Power of an Overshot Water-wheel.

JENNY LIND, Jan. 3, 1865.

MESSRS. EDITORS:—Knowing your kindness in answering queries proposed by miners and mechanics, I have ventured to send you the following, soliciting a reply, by letter or through the columns of the MINING AND SCIENTIFIC PRESS.

E. CHILAUD.

1st. How many horse-power will equal the power of a wheel 24 feet in diameter, with buckets receiving the water of a flume carrying 60 inches water (miners' measure), and emptying in the buckets, with three inches fall from the flume to the buckets?

2d. How many horse-power will equal the power of the same wheel having a pulley on its shaft six feet in diameter, over which a belt is running to another pulley three feet in diameter, affixed to a pump?

To find the power of your overshot water wheel, you must first multiply the number of inches of water, miners' measure, by 2⅓, which will give you the number of cubic feet of water that are used per minute on the wheel. The 60 inches of water which you have multiplied by 2⅓ gives you 140 cubic feet of water per minute, which amount multiplied by 62½ lbs. gives 8750 lbs. per minute, which multiplied by 24 feet, the diameter of the wheel, gives 210,000 lbs. one foot high in one minute. Hence, 210,000 divided by 33,000 gives you 6⅓ horse-power.

But, on a common wooden overshot wheel of 24 feet in diameter, and using the amount of water above designated, there is about 2⅓ horse-power lost in friction, wasteage of water, and other causes, so that you cannot count on more than 4-horse power. The three inches clearance or fall between the flume and top of the wheel is probably no more than is required to give the water as fast a motion, before striking the wheel, as the wheel has itself. This ought always to be provided for. The amount of clearance needed depends upon how fast the wheel is intended to turn.

The size of the pulley on the water-wheel shaft makes no difference in the power of the wheel, for you will find, if you take off your six-foot pulley and put a three-foot pulley in its place, your water-wheel will run just as fast again, but the pump will move with the same speed as before, and accomplish just the same amount of work; or if you put a twelve-foot pully in place of the six-foot, your wheel will only run one-half as fast, but each bucket will take just twice the amount of water that it did previously, while the pump will run with just the same speed as before, and do the same amount of work.

The larger your pulley is, the slower your wheel will run, and the slower your wheel runs the heavier will be the load of water in it; so that it must be built stronger, and with more room in the buckets, if it is to be run slow, than if it is to be run fast.

It is just like two men carrying bricks up a ladder. If they both do just a day's work apiece, and one of them carries ten bricks at a load and the other twenty, the former has only half the weight to carry at a trip, but he has to make double the number of trips, which amounts to about the same thing in the end, only he don't require so stout a ladder to carry his load upon as the man does who carries twenty bricks at a time. The same principle holds good in all kinds of machinery—steam engines as well as water-wheels.

MORE ABOUT THE GATLING GUN.—Canal boats in North Carolina are armed with the Gatling gun as a protection against guerillas. The Gatling gun is a novel piece of ordnance; it consists of six chambers, which are made to revolve around a central barrel by means of a crank. The charges are poured into a hopper, and the gun is self loading. It will throw from seventy-five to one hundred balls per minute, the number of discharges depending upon the speed with which the crank is turned. Officers here speak confidently of the success and effectiveness of this novel piece of ordnance; so that if the guerillas interfere with the *Gazelle*, they will be greeted with a continuous shower of bullets. All the boats that ply on the canal will hereafter be furnished with the Gatling, or, as the irreverent term it, the "coffee-mill" gun. This gun, it, will be recollected was first trial against an enemy on one of Butler's defences near Petersburg.

Forging Iron by Hydraulic Rams.

Some time ago Mr. Henry Bessemer patented a highly ingenious form of hydraulic press for forging metals. An ordinary ram of a hydraulic press is in communication through a pipe with the usual force-pump plunger, driven with a crank on a shaft provided with a heavy fly-wheel. The barrel, in which is working the plunger, is unprovided with valves, and is continued as a simple pipe till it communicates with the cylinder of the press. The water between the plunger of this kind of pipe and the ram thus acts as a communicator of motion between the two, and they rise and fall through distances varying respectively as the areas of the plungers. It will be seen that the heavy fly-wheel does the principal work in compressing; for as soon as the rams—the propelling plunger and the driven plunger—meet with resistance, the inertia of the heavy fly wheel at once comes into play. We do not know as this invention has been found successful in practice. A yet more recent patent of Mr. Bessemer embodies the plan of supporting the bearings of the bottom roll of mills, for rolling armor plates, on a hydraulic ram. This ram is in communication with water pressure, which can be let on or off, as required, by means of a valve. In case the armor plate being rolled should stick—as often takes place—the water below the ram is let out, with the result of relieving the plate from pressure.

It is scarcely possible to over-estimate the importance of the application of the hydraulic press for forging purposes, and it may be ranked almost as high in the scale of practical improvements in working iron as the introduction of the steam hammer. It would seem to fit in with the recent inventions, giving us a command over the production of steel in large masses, affording, as it does, means of working a substance of much more delicate manipulation than even wrought iron. Nor does the use of the hydraulic press seem to be confined to working of iron and steel in an incandescent state, as is evidenced in the remarkable production of steel tubes drawn cold by hydraulic pressure.—*London Engineer.*

THE MOTION OF BOMBSHELLS.—At night, writes an army correspondent, we can see the path through all its journey, lighted as it is by the burning fuse. When the range is two miles, the track of a shell from a mortar describes very near half the arc of a circle. On leaving the mortar it gracefully moves on, climbing up the heavens till it is nearly or quite a mile above the earth, and then it glides, and for a moment apparently in a horizontal line; but you quickly see the little fiery orb is describing the other segment of the circle. A shell from a parrot gun in going two and a half miles, deviates from a straight line not quite as much as a shell from a mortar. But in passing over this space considerable time is required. The report travels much faster than the shot. A shell from a mortar will make a distance of two miles in about thirty seconds, and from a Parrott gun about half the time. The flash at night, and the white smoke by day, indicate the moment of discharge, and fifteen or twenty seconds give time to find a cover in a splinter roof, behind a trench, or something else.

REDUCTION OF WAGES.—It is reported that the principal mines at Reese River have determined to reduce the wages of miners one dollar per day. The Reveille says that "in view of the high prices paid for all the necessaries of life at the present time, we can't see how laborers would subsist on less than they are getting."

THE highest salary of the Governor of any State in the United States, is received by Gov. Low of California. He gets $7,000 in gold. Gov. Curtin of Pennsylvania, and Gov. Seymour of New York, receive the next largest—$4,000 in paper.

IN Texas the circulating medium is gold and silver. Confederate paper is not currency there The Texas crop of cotton has been destroyed by the worms, but corn abounds.

A boy ought to be like a cat, so that tumble him into the world any-way he will strike upon his feet.

THE highest ascension ever made in a balloon, was that accomplished by Messrs. Coxwell and Glaisher, from London, Sept. 5th, 1864. The altitude reached was six miles.

THE great Bank of Commerce, New York, with $10,000,000 capital, is going into the national system.

A case involving twenty-five millions of dollars, probably the largest sum that was ever litigated, is now before the U. S. Circuit Court in New York.

A gang of guerillas has been discovered in Cincinnati fitting out an expedition. They were found with arms and equipments in their possession, and were stopping at several taverns. Ten have been arrested.

TAHITI COTTON RAISING PROSPECTUS.

The undersigned proprietor, soliciting subscriptions to proceed as soon as practicable to the Island of *Tahiti*, to engage in the culture of cotton, wishes for the purpose of closing the subscription list as quickly as possible, and to commence active operations, to call your attention to the enterprise, by placing before you its aim and anticipations, and a brief exhibit of estimated outlay and returns.

Tahiti is one of the Society group of islands, lying in Latitude 20° South, and Longitude 150° West, possessing a soil and climate particularly adapted to the production of cotton, and producing, in abundance, all the fruits and products common to a tropical climate. It is about 2,800 miles from San Francisco, and vessels are constantly plying between this city and the islands, making the trip in from twenty-eight to thirty days.

We call your attention to the following letter, appearing in the San Francisco *Evening Bulletin* of November 16th, 1864:

Tahiti as a Cotton Growing Field.

Cotton has been grown on the Society Islands for a number of years, but although known to be of a superior quality, little or no attention has been paid to the raising of it as an article of export. Since, however, the present war in the United States has in a great measure cut off the supply to France, the Protectorate Government of the Islands has been authorized to offer a large bounty for an extended production of this plant. A wealthy English company—being informed as to the suitableness of the soil and climate of Tahiti, for the growth of a superior staple of cotton—has already bought a tract of land of several thousand acres, and have all the necessary machinery on the spot, and some 300 acres cleared and planted. The crop was looking fine when the schooner Eliza, Capt. Clark, left the Island.

Last October a year ago, Capt. George Dexter planted an acre of cotton as an experiment, and although he obtained but a partial stand of plants, owing to the ignorance of his native help, he still gathered 1,200 pounds—seed and all—which he readily sold on the spot for twenty cents per pound, equal to seventy cents a pound when ginned. The plants are now in their second year's growth, and are literally breaking down with the weight of the bolls, so that a crop of at least 2,400 pounds may be expected, which will bring in $480. One great advantage to the Tahitian cotton grower, is, that the crop does not mature, as it does with us, almost at once, thus rendering its prompt gathering absolutely necessary. In his case there is a long interval to gather in, as the top bolls are yet green while the lower ones are bursting out. Samples of Tahitian cotton, sent to Manchester, England, were pronounced fully equal to the best upland, in fineness and of a longer staple—a near approach to the sea island cotton of Carolina and Georgia. A large proportion of the land on Tahiti is suitable to the growth of cotton and can be had for from $6 to $10 per acre, title perfect. The labor is native, being furnished from the island of Manges, the best, indeed almost the only native labor to be had. The wages paid Manges men is from $8 to $10 per month, the men supplying their own food. The only enemy to the cotton plant, as yet seen, is a small worm about an inch long, black and green in color. This worm has not as yet been notably destructive.

To any person or company seeking cotton lands, the writer would recommend Tahiti where security to life and property is perfect, where lands and labor are cheap, and where the climate is not excelled in the world. Tahiti will be found much superior in all respects to Mazatlan and its neighborhood as a cotton field for American and other cultivators. C.

We propose purchasing, clearing and seeding 200 acres of ground. Taking as a basis the above prices and probable yield per acre, the product of 200 acres would amount to $96,000. But we prefer making an allowance for a short crop, or depreciation in price, by reckoning the first crop, at all events, just one half the proper estimate for 200 acres—say 1,200 pounds in the seed to the acre at twenty cents per pound $48,000.

ESTIMATED OUTLAY.

Purchase of 200 acres at $10	$ 2,000
Clearing & Seeding	6,000
Tools, &c.	1,000
Wages for 50 men, six months, at $10 each per month.	3,000
Wages for 100 men, one and half month during the gathering or picking season	2,000
Miscellaneous Expenses	2,000
Total outlay with crop ready for market	$16,000
Leaving Net proceeds	$32,000

The above estimate will, of course, on actual trial prove faulty in many respects, but we deem it near enough for all practical purposes.

You will observe from the above that we can *not only pay back from the first crop the capital invested, but* DECLARE A DIVIDEND OF ONE HUNDRED PER CENT. ON $24,000, and reserve $8,000 for taking care of and gathering the second crop, which being raised from the same plant, and the ground already cleared and paid for, the crop will be secured and prepared for market at a comparatively slight expense.

We see no reason why, with our experience, and replanting where we fail to get a good stand of plants on the first crop, our second should not be nearly or quite double that of the first—enabling the company to realize from it a net profit of from $80,000 to $90,000.

We would state here that the amount of money raised on the issue of the stock will be only $16,000, instead of $24,000, as the $20 assessment indicates.

The compensation allowed us for services to be rendered the company being $8,000, just sufficient to offset the $20 assessment on 400 shares of the stock subscribed for by us. We appropriate no money for our time, confidently depending on dividends from our stock for amply repaying us for our enterprise and labor. No further assessment will be required.

Subscription books are now opened at the Oriental Hotel corner of Bush and Battery streets, on Market. Office hours from 10 A. M., to 4 P. M., and from 6 to 9 o'clock P. M.

ISAIAH WESTON, Manager.

HUNGERFORD & PRATER'S CONCENTRATOR.

The proprietors of this New Concentrator having completed arrangements for its manufacture at the Fulton Foundry, in San Francisco, now offer it to the public, with the fullest confidence that for the purpose for which it is designed, IT HAS NO SUPERIOR IN USE. The principle of this machine, which is designed for a Concentrator, only, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind any other machine in use.

This machine is now running over waste sands, at the European Metallurgical Works of Messrs Kimball & Murphy, on Bryant street, between Third and Fourth, in San Francisco. These gentlemen have furnished the following certificate with regard to its efficiency, as ascertained from actual use at their Works:

SAN FRANCISCO, DEC. 5, 1864.

Having in use one of Prater & Hungerford's Concentrators in our mill, and having fully tested its merits, we take great pleasure in being able to recommend it to the mining public, as being a decided success. The principle on which it is constructed being the only true and mechanical one for the purpose of concentration—centrifugal force and gravitation, combined as they are in this machine—cannot fail to accomplish the object sought. Having worked all the ores passing through our mill, in the most careful and skilful manner, our tailings seldom assaying anything worth looking after, were consequently allowed to waste. Yet on trial of this Concentrator, we are now able to save all to within 2½ to 5 per cent of the assay, besides effecting a large saving of float mercury as well as amalgam which may be wasted by mechanical loss. On a trial lately made by us on a lot of free gold ore of 4300 lbs., though being worked with all possible care, yet by concentrating the tailings we saved $25.

We consider, and feel satisfied that the mining public will agree with us in the opinion that these Concentrators are indispensable to the successful working of all sulphureted ores, after they have given them one trial.

KIMBALL & MURPHY,
Metallurgists, etc... Bryant street, between Third and Fourth.

The proprietors are also allowed to use the following certificate, which has been furnished them by the late Superintendent of the Ophir Company's mill in Washoe.

SAN FRANCISCO, DEC. 10, 1864.

Prater & Hungerford's Concentrator was used at the Ophir Works, Nevada, for concentrating the Pato tailings, viz: to collect the unreduced sulphurets, and the amalgam adhering to them, and they answered the purpose better than any other method in use, with which I am acquainted.

W. W. PALMER,
Late Sup't Ophir Silver Mining Company.

Wheeler & Thayer furnish the following certificate of the working of this Concentrator, at their mill in Sonoma, Tuolumne county, which was published in the DAILY FAIR PRESS, issued during the late Exhibition of the Mechanic's Institute, at the Pavilion.

Sonoma, Sept. 28, 1864.

We have been using one of Prater & Hungerford's Concentrators, at our mill, with the most signal success, for some months past. The yield of the rock at our mill is about $45 per ton, while rock from the same ledge crushed at other mills, not using this Concentrator, is yielding but $25. The sands from the batteries in our mill, are received from the stamps direct into the Concentrator, which effectually separates all the gold, amalgam and sulphurets from the rock, with the above results.

WHEELER & THAYER.

☞ Orders or letters of enquiry in relation to the above Concentrator may be addressed to HUNGERFORD & PRATER,
Proprietors.

San Francisco, January 1, 1865.

Mining Summary.

ESMERALDA.

The Aurora *Union* speaks most encouragingly of the mining prospects in Esmeralda. Bad management, alone, is given as the cause of past embarrassments. Most of the mines opened are known to contain gold and silver in sufficient quantities to pay, when the requisite amount of capital can be had and under conditions where it can be judiciously expended. Economy is now the watchword there, and the *Union* feels confident that it will win. The great improvements being introduced in reduction and amalgamation will also add to the desired result. The late experiment with handmills has shown that nearly every company of working miners may make themselves comparatively independent. Every frugal and industrial miner owning a claim can now have his own quartz mill, of a capacity sufficient to develop his mine.

Recent favorable accounts have been received from the new district of Columbus. A party has lately arrived at Aurora from that neighborhood who report that there is an abundance of wood within a short distance of the mines, and that the leads in the district are large, rich and well defined. He brought to this city about twenty-five pounds of excellent rock, and seems to regard Columbus with much favor. One piece of rock was brought in said to have been taken from one of the leads in Columbus, a portion of which was covered with pure, massive silver.

The Utah mine, says the *Union*, has recently turned out some very rich rock. The last crushing gave nearly $60 to the ton—the bullion being valued at over $4 to the ounce. Mr. Theo. F. Moss, Sup't. of the company, says that it is the intention to suspend operations on the mine till spring, the bad condition of the roads on Silver Hill rendering it almost impracticable to deliver ore to the mills.

REESE RIVER.

Time, labor and capital are actively employed in proving the existence of good mines in Reese River. The surface workings which characterized last year's operations are now giving place to legitimate mining upon the depth of the veins. Experience having also been obtained in the working of ores, together with a better knowledge of the character of the ores themselves, the mills of Reese River are now generally doing a satisfactory business. Five out of the seven at Austin have furnaces for roasting the sulphurets, and two of the number are adding to their crushing power. Although the principal attention has heretofore centered in Austin, there is no good reason why the outside districts may not also soon prove of at least proportionate value. The districts of Cortez, Amador, Bunker Hill, Washington, San Antonio, Twin River and Union are already beginning to attract considerable attention. There are mines in each of these districts which present unmistakable indications of value. The ledges generally appear equally as permanent as those at Austin, and probably need only the same time and labor to be bestowed upon them to bring them to an equal footing in value. The mines of Reese River stand well in the New York market, and much capital is now finding its way thither for the great Atlantic emporium.

The Shoshone Company's claims, according to the *Reveille*, are still producing considerable quantities of rich ore. A lot of rock from this claim recently sent to San Francisco yielded at the rate of $4,000 to the ton. The ledge is small, but what it lacks in size is fully made up in quality.

The Social Gold and Silver Mining Company, under the management of Mr. O'Dougherty, have erected a fine steam mill near their mine in Gold Cañon, and are now working with very flattering prospects. They have fine buildings, good roads, timberlands, and one of the best mines, apparently, yet discovered in the State. Several lots of rock from the Gillegan lode have been worked in San Francisco which have paid in the neighborhood of $4,000 a ton, and have fully proven the value of that lead. The mines, woodlands, water privileges, mill, etc., of the Social Company at Egan Cañon and Gold Cañon, bid fair to become one of the most valuable properties in the State of Nevada. The people at Egan consider their ledges inferior to none in the country, and with the coming spring we may look for extensive and rich developments from that region.

Messrs. Givens & Co., whose claim is located near the Morgan & Muncey, have struck their ledge at a depth of forty-three feet, and are now taking out fine rock. At this depth the ledge is about one foot wide, and well defined.

Messrs. Strong & Robinson have leased the Farris mill and are now completely renovating and refitting it. A splendid new engine has been put in, and other improvements are contemplated, which will render it a first-class institution. A new ledge was recently struck near this mill while sinking a well. The ledge was discovered at a depth of about twenty feet, is about six inches thick and pure chloride rock.

Horace Perry and James Peoples have found a very fine lode near Roanoke, in upper Austin. The lode is about two and a half feet wide, and contains an exceedingly rich pay streak about four inches wide. A lot of eighty-five pounds was worked by Johnson & Co.'s horse power mill and the bullion melted and assayed by Currie, gave the large result of $103 18.

HUMBOLDT.

The mines of Humboldt are of that peculiar character which requires an unusual amount of skill, labor and capital for their development. The stubborn character of the ores, and the extensive works requisite for a thorough development of the mines, and the general discredit which was at first industriously thrown upon the mines has rendered their development slow; but that very delay will only render the work more sure. There is little doubt but that, when once fairly opened, the mines of Humboldt will compare favorably with those in any section of the country. A number of wealthy capitalists have recently made large investments in these mines, and such of them as have visited the mines personally express themselves as being perfectly satisfied with the mineral resources of the district. Among the capitalists who have recently become prominently interested in these mines we might particularly mention Capt. O'Connor, of the large English mining company located on the Truckee river. Capt. O'Connor, who is an old and experienced miner, appears to be fully satisfied to invest there, and has made arrangements for starting work on the Whitmore ledge, a fine mine on the Sheba belt, and the second claim south of the Original Sheba, the Desert lying between. He is of opinion that there are heavy deposits of silver in that belt, though it may take some capital to lay them open. An intelligent correspondent, speaking of the Captain, says that with a few more such men of faith, means and energy to take hold of the ledges there, it would not be long till Humboldt would be the scene of stirring industry and her shipments of bullion be second only to those of Virginia itself.

The Evening Star Company, who own several mines in Trinity District, have recently erected there a 5-stamp mill, which is now pounding away, night and day, and turning out a fair amount of bullion from several paying ledges. The company has already made several shipments, varying from two to four thousand dollars each. This mill is of the same size and pattern as the Sheba mill. Some thirty or forty miners are now at work in the district, which force will be increased as rapidly as the mines are sufficiently opened.

The Prospect, according to the *Register*, is one of the very best prospects ever found in the country. It measured six feet four inches in the croppings, and in a few feet below the surface is found to be full seven feet wide, and well cased. It contains a variety of silver ores, and in large quantity, considering the slight depth made. It is located in Buena Vista District.

Echo District is pronounced by a gentleman who has recently carefully examined it, and reported to the *Register*, as a very promising locality. G. W. Holt has a fine mill about ready to start in this district, which will enable the owners of ledges there to have their rock crushed, without being to the expense of hauling it a long distance over a mountain to a distant mill. The principal ledges in this district are enumerated as follows, by the gentleman above alluded to:

The first ledge visited was the Havana, which I found to be fourteen feet wide and containing good mineral.

The Carson I found to be full forty feet wide, and showing the same character of mineral as the Havana. This ledge is a continuation of the Wilson---which has a tunnel of two hundred feet and a shaft thirty-two feet deep.

Next, the Nevada, five feet wide, showing the same character of mineral as the first two named.

I next visited the Washington series, where owned by the Madison Company; the same series, where owned by the Jefferson Company; and the American series, owned by the American Company. These three locations are in a continuous line, and each consists of three veins of quartz, of the same character as the above mentioned ledges, and each vein being two and a half feet wide. The ledges in these series are fifty feet apart.

CALIFORNIA.

Sierra County.—The *Mountain Messenger* continues to report favorably of mining operations in Sierra county. The Slug Canon Quartz Mill, under the superintendance of Capt. Blunt, appears to be doing a good business. The mine upon which it is located is an old one from which about $45,000 were taken a few years since, by an arastra. There is rock enough in sight to supply the mill for a long time, and there is every indication that the mine will yield a handsome return for the investment.

A correspondent writes the *Messenger*, from Sierra City, that a rich deposit of quartz was recently discovered between that place and the Buttes, one sack of which, taken from the surface, yielded $700 from crushing in a hand mortar.

A quartz mill of a somewhat novel construction has recently been put up on a claim discovered by Mr. A. R. Bishop, in July last, between the junction of the north and south branches of Kanaka Creek. The reducing machinery of this mill consists of four of Disney's Grinders. Two amalgamators are employed to each grinder. The whole is driven by a 15-horse power engine. Near by is the Occidental Ledge, owned by Bishop, Sherwood, Disney, & Co. They have contracted for a mill and expect the material to go up as soon as the roads will permit. Their ledge is four feet in width, and has been thoroughly tested. Judge Sherwood, of San Francisco, has invested largely in this mine. The placer miners, especially about Gibsonville, are busily employed in improving the chance of the present abundance of water, to wash up their drift dirt and to break down new ground.

The North American Company are taking out large amounts of "oro," The Phœnix are washing with two heads of water. The Gem Company is washing with good prospects, and keeping their reputation of having one of the best claims in the county.

The Visalia *Delta* says that a vast quantity of rich quartz, easily accessible, has been discovered in Clear Creek district. Some of the miners are putting up arastras to reduce it; others are contemplating mills. One party, Mr. J. H. Thomas, is already engaged putting up a mill, which will soon prove the value of the discovery.

Reports reach the editor of the Stockton *Independent* from the mining region of Calaveras, Amador and Tuolumne, to the effect that the miners are doing better this winter than they have done any year since 1856. New placer mines are being worked, owing to the abundance of water, and the old ones are found to pay very well for working over again.

The San Andreas *Register* is informed that Rathgeb & Bros., a company of Frenchmen who have been prospecting a gold-bearing quartz lode, at Lower Calaveritas, for the last three years, have struck it rich, and that they have sent to San Francisco and purchased a ten-stamp quartz mill, which they are about to erect on the claim. They have a large amount of rock on hand and will commence to crush it as soon as they can get their machinery in operation.

The Extraction of Gold and Silver from their Ores.

A few days since we published an article on this subject, in which we stated that at least twenty-five per cent. of the gold and silver contained in their ores was lost in operating on them. Some of our cotemporaries took exception to this statement, which we made on facts gathered and experiments made during the past ten years. As an illustration of the truth of our statement, we refer to the last report of the Superintendent of the famous Gould & Curry mine; one on which the best machinery and most skillful amalgamators and chemists are employed. By that report we learn that the yield of the mine for the year ending on the first instant, was $4,808,000—in round numbers $5,000,000; which sum was obtained from 66,000 tons of ore, averaging about $75 per ton, the yield of which was only seventy per cent. of the assay value; so the tailings of the Gould & Curry of last year contain $2,000,000! To prove that this tremendous waste is not unavoidable, we cite the fact of a company giving the Gould & Curry $30,000 for 1,000 tons of these tailings and reworking them to a profit! There are probably scores of persons in this county who remember Capt. Kidd's old mill on Big Deer Creek, which did not save ten per cent. of the gold in the rock. There are many such mills now in operation in this State, the tailings of which would pay well to re-work by a proper process. It is our belief that nearly all of this waste might be avoided by the use of the proper machinery and skill. The question may be asked, if this were so, why the Gould & Curry company, with all their improved machinery and skilled labor, lose so large a percentage of their bullion. Were we a shareholder in that company, we should certainly ask such a question. There is not the least doubt that nearly the whole of this loss arises from the improper use of mercury in amalgamating. As we stated in the previous article on the subject, to grind mercury with the ores is certain to entail loss.

But most of the professional amalgamators are so wedded to old notions that they will not even listen to reasons for their abandonment. Few of them being men of science themselves, they look with disdain on those who are. When mercury is minutely subdivided, the almost invisible globules become so coated with impurities that they lose the power of adhesion and will never re-unite, unless force is used, and that force very different from grinding. This principle is beginning to be understood among the inventors of amalgamating pans, and the grinding of the mercury is avoided as much as possible—those saving the most metal that grind it the least. The best machine for this purpose, that has come under our notice, is the pan invented by Baux & Guiod, which obtained the first premium at the last Mechanics' Fair at San Francisco. This pan differs from all the others in not mixing the mercury with the ores at all, but having a quantity of it on the outer edge, the particles of gold and silver in the ores, owing to the peculiar structure of the mullers, are injected into it by the centrifugal motion imparted to them and are forced to combine with, without dividing the mercury. The most improved Varney pans have slips of wood set into their bottoms to save the grinding of the mercury. The Wheeler's Tractory pan, a very scientifically arranged contrivance, confines the mercury to the center to avoid its being ground. The Gould & Curry use both the Varney and Wheeler's pans, with the result above stated. The fact that the loss of mercury in the mills in the State of Nevada exceeds *one hundred tons per annum*, and in this State probably much more, is a proof of our statement that the loss of the precious metals, amounting to upwards of twenty millions of dollars per annum on this coast, arises from its improper use, for mercury never escapes without taking the other metals with it. As we have stated above, amalgamators are so wedded to their old notions that they will not listen to new ones, or the practice of agitating tailings, as they flow off, to cause the fine particles of mercury, gold and silver to settle, so contrary to every scientific principle, would have been abandoned long since. * * * In those remote ages, before the existence of this great continent was ever conjectured, though the discovery resulted from Columbus' search for Cathay, where gold was said to be had in abundance, the greater portion of the silver used was obtained from the mountains in certain portions of what is now known as Spain, where extensive smelting works existed before and after the days of the Roman Empire, and this fact furnishes a proof to support the argument to prove which these articles are written. The debris of these ancient silver mines, now yield a large income to a company which has been engaged for years in re-working them, as will the "tailings" from our present processes to some future metalurgists. Nearly all the silver of the ancients was obtained from the ores of lead, with which metal it almost invariably exists in combination in nature.

Within the past ten years, such improvements have been made in separating these metals, that by a process invented by a Mr. Pattinson, of Cumberland, England, it is profitable to extract the silver from the lead where it exists in the proportion of only two ounces to the ton!

In Reichenstien, Silesia, where there were gold mines worked nearly six hundred years ago, but abandoned through want of a proper process to save the precious metal, within the last, say fifteen years, Professor Plattner, of Freiberg, has perfected a process by which it is profitable to work ores that contain only 200 grains of gold to the ton; and these ores are arsinical pyrites, abounding in almost inexhaustable profusion in many parts of this State. This process is the foundation of all the "new systems" for working sulphurets by chlorine gas. Until the discovery of the immense gold deposits in this State, nearly all the gold in Europe came from "Afric's golden sands," on the Guinea coast; the silver from England and Spain. Up to that discovery, according to the calculations of men conversant with the subject, the total quantity of gold in the whole world was valued at $2,800,000,000. Previous to that discovery the whole gold product of the world did not exceed $30,000,000 per annum, but little, if any more, than six month's yield of the mines of California. Since 1849 California has produced upwards of $800,000,000, in gold, and lost nearly half as much more through want of proper means for saving it. —*Grass Valley Union.*

Six or eight wooden buildings were burned at San Jose on the first instant.

It is Impossible for editors to know all the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:
Saturday Morning, Jan. 14, 1865.

A FINANCIAL AND COMMERCIAL REVIEW.

The past year opened auspiciously to nearly all classes. Money was abundant, and general business in every department of trade had never been more prosperous. At that time, however, owing to these and other causes, a speculative excitement ensued in almost every description of mining property, and prices became very much inflated. This was followed by a revulsion early in the Spring, and all mining stocks declined rapidly, producing, in a short time, great embarrassment. The mercantile classes were affected, in some degree, by this panic in the stock market, and early adjusted themselves to meet the exigencies of the moment. The agricultural inefficiencies of a great portion of the interior at this time also gave rise to serious apprehensions, and business was for a while quite restricted. But the regions norte of us—Oregon, Washington and Idaho—had been favored with ample rains, and abundant harvests and prolific gold fields were at once insured to the people of these localities, which gave great importance to our North coast trade, and compensated, in a measure, for the contraction of commercial interests nearer at home.

During the Summer and Fall, our merchants enjoyed a season of comparative prosperity, and, although collections from the interior were retarded, few or no failures have occurred, and at the close of the year their condition is believed to be far more satisfactory than was anticipated.

The country is also in a more prosperous condition than was expected, and since the rainy season set in, the agricultural classes have been looking forward to active and profitable employment throughout the coming year. The placer mining interests have already sprung into life again, and thousands of sturdy miners are vigorously at work.

The arrival of vessels with cargoes at this port, from all quarters, during the past year, amounted to 2,096, with an aggregate tonnage of 739,190 tons. 120,000 tons came from domestic Atlantic ports, 283,000 from Pacific, and 325,000 from foreign ports. 175,000 tons of merchandize were received by the Panama, Mexican, Victoria and Portland steamers.

The increased importations of merchandize are confirmed by the following statement of freights paid, with the comparison for the past three years:

From	1862.	1863.	1864.
Domestic Atlantic Ports..	$2,343,419	$2,815,504	$3,747,672
Panama, per steamers....	1,055,594	2,085,815	2,350,130
Principal Foreign Ports...	1,156,559	1,207,338	1,491,595
Other Foreign Ports.....	388,749	441,493	490,2 3
Total freights on cargoes..	$4,944,321	$6,548,150	$8,109,610

Our exports of merchandize, copper, wool, etc. during the past year, amounted in the aggregated to $13,271,000; and the total value of all exports was as follows:

	1862.	1863.	1864.
Treasure.....	$42,561,761	$46,071,920	$55,707,201
Merchandize.....	10,565,294	12,877,399	13,271,752
Total	$53,127,055	$58,949,319	$68,978,953

The following shows the receipts of treasure in San Francisco, through public channels, during the past three years:

	1862.	1863.	1864.
Receipts from Interior..	$42,539,799	$45,327,326	$45,460,415
Receipts from N'n Const..	4,031,579	4,976,023	8,062,368
Imports (foreign).....	1,904,084	2,156,612	1,715,024
Total.....	$49,375,462	$52,453,961	$55,228,407
Exports.....	42,561,761	46,071,020	55,707,201
Curr'cy movement inc....	$6,813,701 inc.	$6,382,941 dec.	$476,794

Oregon, British Columbia, and Washington and Idaho Territories have probably sent us $2,000,000 more than the Express records show. California has furnished about $29,000,000, and the silver districts of Nevada some $16,000,000. These arrivals of treasure include coined gold and silver; but the product of the precious metals on this coast for the year 1864, has probably exceeded the aggregate receipts of both coined and uncoined, as shown by the books of the Express companies, if we make a proper allowance for the arrivals in private hands and to private consignment.

The disbursements of the Government on this coast for the past year amounted to $9,670,000. The total income during the same period has been as follows:

From duties on imports, in coin.....	$5,970,156
From inland taxation, in currency.....	2,323,643
Oregon and Territories (estimated).....	200,000
From the sale of stamps.....	106,645
From Post Office Department.....	265,000
Total income.....	$8,925,444
Excess of expenditures.....	645,212
Total expenditures in 1863.....	9,885,531
Total income in 1863.....	7,128,399

The funded debt of the city and county of San Francisco now amounts to $4,413,393, and the assessed value of all property is fixed at $62,403,488. The State tax is at present $1.25, and the city and county $1.73 per $100.

Heart Disease Among Horses.—The heart disease, so prevalent among the human species of this city, seems to have recently extended to man's best and most useful friend in the brute creation—the horse. Not less than four equine deaths have occurred in this city within the last two weeks from this disease. A post-mortem examination in these cases showed that their hearts had enlarged to three times their natural size. No premonitions seem to be given; the animals performing their duty freely up to the moment of death. The cases reported, thus far, have been of a superior class of animals, and such as have not been overworked at the time of their decease, or at any known previous period.

H. H. Bancroft & Co.—We have received from these enterprising publishers, a very pretty pocket diary for 1865, gilt-edged, and containing a large number of tables for reference, including Federal and State Stamp Duties, Epochs and Eras, Laws of California, Oregon, Washington and Nevada for collection of debts, and many other matters of importance, besides an Almanac for 1865 and a Counting house Calendar. From the same firm we also received the Pacific Almanac for 1865, containing an invaluable mass of statistical information concerning the Pacific Coast. These little books, are in themselves a library of most important facts, required often to be referred to in our every day business.

A Chance for the Unemployed. — The Central Pacific Railroad Company advertise for 5,000 laborers, to work upon the road between Newcastle and Illinoistown. It is the intention of the Company to employ at once as many men as can be advantageously worked on the distance between these points—twenty-three miles. The iron for laying this additional amount of track is already in Sacramento, and it is expected that the cars will run to Illinoistown by August next. The above opportunity affords a chance for those out of employment.

Oranges.—It is stated that there is an orange tree growing (in the open air?) in the vineyard of B. N. Bugbey, near Folsom, which is sixteen feet high, and has on it a crop of about two hundred oranges. It blooms and blossoms through the entire Summer and Fall.

The high revenue tax on matches is causing a great falling off in their manufacture, and three large concerns have recently moved their establishments from Maine to New Brunwick, as they can be imported for less money than the home tax amounts to.

AMERICAN MILITARY ENGINEERING.

A late correspondent of the London *Times* urges the importance to England of being represented in this country by one or two of her ablest military engineers to the end that they may learn aright the lessons of modern warfare. He states that at the recent erection of some forts at Duppel, a capable Prussian engineer adopted the peculiar system of earthworks and traverses, which he had seen at the month of Cape Fear river, in North Carolina, and proves that Europeans might learn valuable lessons from American military engineers—lessons quite as valuable as was taught them by the genius of Todlebein in the Crimea. Equally valuable lessons, he thinks, might be learned in artillery practice and construction. The important lesson taught the English and French, in their own mingled waters, by the fight between the Kearsage and Alabama, in practical gunnery, armament and seamanship, will never be forgotten, and has already been profited from by at least one of the parties. The evidence of a mixed battery of pivot and broadside guns, judiciously proportioned in caliber and range to the vessel which bears them, and which has been adopted as the standard of our naval system, was fully vindicated on that occasion. This fact was immediately perceived, and unmistakeably understood, by the officers of the French navy at Cherbourg, who did not fail to avail themselves of the opportunity thus afforded of studying these details of armament as they appeared on the Kearsage after her triumphant return to that port. A more important lesson in the same line was soon after read to the world from the waters of Mobile Bay. The French have been prompt to profit by these lessons—the English may live to rue the day they neglected to do so.

Gun Cotton in the Army—Nitre.—It is stated by the Chief of the Ordnance Bureau, in his annual report, just published, that experiments will soon be made with gun cotton, with reference to the practicability of adapting it for ordnance use. A curious circumstance is also stated in this report, to the effect that the present war has developed the fact that from twenty-five to fifty per cent less nitre is consumed in the country in time of war than during peace. The circumstance is accounted for on the ground that vast quantities of this article are required in times of peace in the arts and manufactures, which are to a great extent interrupted during a protracted war. It is also stated, on good authority, that even the present consumption of gunpowder, enormous as it is, for war purposes, is less than it was during several years of peace which immediately preceded the war.

Extending the Limits of Navigation on the San Joaquin.—The San Andreas *Register*, of January 7th, says that during the late low Summer stage of water, a company of enterprising individuals took that favorable opportunity to clear the bed of the Mokelumne (a hitherto unnavigable tributary of the San Joaquin) of its obstructions. It is thought at the present time there will be no difficulty in light-draught steamers going up that river as far as Woodbridge. The attempt to do so is about to be made. Should it succeed, the head of *Winter* navigation will be extended some twelve miles above Stockton.

Cotton Raising.—This branch of agriculture is now attracting much attention among our citizens. There is no doubt that cotton raising in Southern California, Mexico and on the islands of the Pacific will prove exceedingly profitable, but, like mining enterprises, much depends upon the honesty and experience of operators. Capt. Isaiah Weston, an active working man, who has had familiarity with cotton fields in Texas, publishes a promising prospectus, in another column, for introducing cotton raising at Tabiti, one of the most beautiful and luxuriant isles of the Pacific ocean.

Queer Title.—*The World Without End* is the title of a new four-paged paper just started at Memphis, Kentucky.

Mining and other Incorporations in 1864.

The books of the Secretary of State exhibit the following statistics of incorporations formed in California during 1864:

January.—Gold and silver mining companies, 156; copper mining companies, 18; ditch and irrigation companies, 2; manufacturing company, 1; miscellaneous, 5. Total, 182.

February.—Gold and silver mining, 141; copper mining, 9; coal mining, 2; manufacturing, 3; miscellaneous, 5. Total, 160.

March.—Gold and silver mining, 100; manufacturing, 4; copper mining, 12; ditch and water, 1; miscellaneous, 4. Total, 121.

April.—Gold and silver mining, 69; copper mining, 16; manufacturing, 6; miscellaneous associations, 7. Total, 98.

May.—Gold and silver mining, 39; copper mining, 8; agricultural and manufacturing, 7; water and ditch, 1; coal mining, 1; miscellaneous, 3. Total, 59.

June.—Gold and silver mining, 32; copper mining, 3; tin mining, 1; salt mining, 1; miscellaneous associations, 3. Total, 40.

July.—Gold and silver mining, 29; copper mining, 4; agricultural and manufacturing, 2; miscellaneous, 5. Total, 40.

August.—Gold and silver mining, 19; copper mining, 5; manufacturing, 1; water and ditch, 5; coal mining, 1; quicksilver mining, 2; marble quarrying, 1; toll roads, 3; banking and insurance, 4; miscellaneous, 9. Total, 50.

September.—Gold and silver mining, 4; copper mining, 1; toll roads, 2; insurance, 1; miscellaneous, 4. Total, 12.

October.—Gold and silver mining, 8; copper mining, 3; water, 4; manufacturing, 1; quicksilver mining, 2; tin mining, 1; miscellaneous, 3. Total, 22.

November.—Gold and silver mining, 7; copper mining, 1; water and ditch, 2; coal mining, 1; manufacturing, 1; insurance and banking, 2. Total, 14.

December.—Gold and silver mining, 6; manufacturing, 1; toll road, 1; railroad, 2. Total, 10.

SUMMARY.

Gold and silver mining companies.....	610
Copper mining companies.....	80
Coal mining companies.....	6

Quicksilver mining companies.....	4
Salt mining companies.....	1
Marble mining companies.....	1
Manufacturing associations.....	27
Banking and insurance companies.....	7
Water ditch and irrigation companies.....	15
Railroad companies.....	2
Toll roads.....	6
Miscellaneous.....	52
Total.....	812

The California Art Union is now fully organized, and was opened on Monday evening last to a few invited guests. It will be opened to the public generally in a few days. A fine hall in the upper story of 312 Montgomery street, over the store of Jones, Wooll & Sutherland, has been fitted up for the association. The number of pictures already in place is one hundred and thirty—nearly all oil paintings—and a large portion of which have been executed by California artists. The association will be conducted on precisely the same principles as the Eastern Art Unions, comprising the collection and exhibition of paintings, pictures and sculpture, and the purchase and annual distribution of works of art among its members. The payment of five dollars makes a person a shareholder for one year, and secures him or her a single chance at the annual "drawing" of prizes. Of course any person can take as many shares as he may wish. The gallery will be open every day, a small admission fee of twenty-five cents being charged. All the receipts over and above the salary of the Custodian, the only salaried officer, and the expense of rent and light will be devoted to the purchase of works of art to be annually distributed among the members, by lot. The institution starts out under more favorable auspices than any of its Eastern cotemporaries at their initiation. The mere announcement that such an association has been thus successfully started in this new city, will excite the most honorable comment among men of all nations, everywhere, where the highest achievements of the beautiful in art are appreciated.

The Camanche.—The work on the Camanche is so nearly completed that she will make her trial trip on the bay, with the naval and military authorities and invited guests on board, some day within the coming week, after which she will be turned over to the military authorities.

ELEGANT MINERALOGICAL CABINET.

We doubt whether anywhere in California, or even on the continent, a richer cabinet of minerals can be found than is now to be seen in the room of Mr. L. W. Taylor, at No. 2, in this (Government) Building. Mr. Taylor has been assiduously engaged, for some three or four years, in getting together this superb collection of rare and valuable specimens, and he is still at his work and constantly making additions. May success attend him and may he reap a fortune from his interesting and scientific enterprise.

Among the beautiful specimens which more particularly attracted our attention, were his *unique* and complete assortment of silver ores —which comprise almost the full of the endless variety of form and structure which that most beautiful and interesting of all mineral ores assumes. His collection of "stephanites" is really superb, while the sulphurets, ruby, chlorides, etc., with wire and other varieties of native silver are also large and valuable. His collection of crystals is large and beautiful, some sparkling like dew drops in the morning sun, others massive and otherwise *unique*. He has one which might be almost taken for a real 'Kohinoor,' so pure and brilliant does it appear. This we understand Mr. Taylor intends to have cut and mounted, as though it were actually the magnificent diamond it appears to be. His shelves contain a fine variety of fossils, also beautiful specimens of jasper, basalt, quartz breccia, serpentine marbles, cements, etc.

What does he intend to do with them? Well, we don't know—don't believe he does himself. His present highest pleasure appears to be to exhibit them, gratuitously, to his friends—to all who may take the trouble to call and examine this fine collection of the works of nature in her dark and subterraneous laboratories. If we are correctly informed, Mr. T. is far from being overburdened with this world's goods, beyond the valuable collection of curiosities, which his industry has transferred from the mine to the shelves of his cabinet. We could wish that some business might find its way to his keeping, which would enable him to further add to his collection, and keep the same open to the free inspection of the public, for the gratification of their curiosity and for instruction.

To Correspondents.—We have received another communication from our New York correspondent. "H. H.," on the subject of iron-clads, which is on file for publication. "C. A.," "Economy in Assaying," will please call at the office or forward us his address. "Music" is accepted. "T. McA." in reply to Mr. Deetken will appear next week. We had intended to have answered the queries of our correspondent "N." with reference to copper smelting operations, in the present issue, but have not had time to give the subject that attention which its importance demands. We will endeavor to do so next week. Our attentive Taylorville correspondent, on the same subject, will receive notice at the same time. The subject of Petroleum, which is attracting so much regard at the present time, will receive extended notice in our next, and probably several subsequent numbers.

The Departing Steamers.—The Opposition Steamer America left her wharf, at Mission street, on Wednesday last, with a full complement of passengers. Several prominent citizens were among the number.

The Pacific Mail Steamship Company's steamer, Sacramento, Capt. Hudson, left her berth, at the foot of Folsom street, yesterday, crowded with passengers. Her rates of fare were as follows: Outside saloon, $175; inside saloon, $125; second cabin, $60; steerage, $43.

The blockade runner Annie, recently captured, dropped $50,000 in gold into the sea while being chased, beside a large amount of Confederate bonds.

The Folsom *Telegraph* heard a practical miner assert the other day that more gold would be taken out the coming season, in that neighborhood, than has been realized from the mines in the last four years.

Canvassing Agents.

We would call attention to the following named agents of the Mining and Scientific Press as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts by friends and old patrons, or our brethren of the Press, will be acknowledged as a personal favor to us:—

Wm. R. Bradshaw—San Joaquin, Calaveras, Merced, Tuolumne, Stanislaus and Mariposa counties.

Mr. Robert Lattimore—Butte and Yuba counties.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

How to make your Remittances.—In most of the mining towns, bankers will furnish checks on San Francisco at par, or at a very slight advance to those who wish to pay us for subscriptions, advertising, mining blanks, etc. When it is more convenient, money may be remitted by mail at our risk if the parties sending will register their letters. Money sent by mail is seldom lost if properly enclosed. An excellent method is that of opening the layers of a card, placing the coins between the layers and sealing the edges together.

PACIFIC
BEATER PRESS COMPANY,
San Francisco, California.

This Company are prepared to manufacture and sell the celebrated PORTABLE BEATER PRESS, so well known in the East, where it has, in the short space of two years, almost entirely superseded all other

HAY AND COTTON PRESSES.

This Press is easily moved from place to place, requiring only two span of horses over any ordinary road; is worked with great facility by steam or water power; and two men with a span of light horses in ten minutes time will turn out a bale of hay, in dimensions measuring three feet eleven inches in length, twenty-two inches width, and from twenty-four to twenty-eight inches in depth, and weighing from four hundred to five hundred pounds.

The fact that Beater Pressed hay commands a better price in market than any other, is substantiated by the market quotations of New York and other Atlantic as well as Western cities. Hay baled with this press is much cleaner than that baled by any other in use, being completely freed from all dust by the action of the beater, besides being so compactly pressed as to be fire and water proof.

This press is equally efficient for Cotton, Wool, Tulu, Tow, Hemp, Hair, Manilla, Oakum, Hops, Rags, Shavings, &c. No other Press can make so good a bale of cotton, and make it retain its compact shape. Parties interested are invited to call and see us in operation.

Office and Warehouse—MISSION STREET, between Main and Beale streets.

H. W. MITCHELL,
General Agent.

1852. 1865.
Thirteenth Year of Publication.
THE GOLDEN ERA,
Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, The Golden Era is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

The Golden Era is now enlarged by the addition of eight columns to its pages—and presents fifty six columns containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render The Golden Era a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome The Golden Era as a regular weekly visitor.

Serial Romances in the Golden Era.

The most popular Novels of the present day are published as Serials, from week to week, in The Golden Era, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the Contributors to the Golden Era are all the prominent writers of Literary Repute in California, and on the Pacific Coast; also correspondents and contributors of distinguished talent in the Atlantic States and Europe; including "Orpheus C. Kerr," Fitz Hugh Ludlow, G. B. Densmore, "Mark Twain," Dan De Quille, Florence Fane, Miss Emma Hardinge, Sarah E. Carmichael, Annie E. Fitzgerald, "Occasia Owen," Alice Mason, William Simpson, Chas. F. Stoddart, "Ina," H. C. Williston, "Albion," "Fairfax," Bonnevel, Mary Kyle Dallas, Margaret Hosmer, and many other accomplished writers of Fiction, Romance, Novels and Stories, Poetry, Essays, Sketches, etc., etc., comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States or Europe.

Subscriptions to be Paid in Advance.

ONE YEAR $4. SIX MONTHS $2. THREE MONTHS $1.

Take care to write distinctly the name of the person; the name of the city, town or locality where the Post office is situated, and the name of the County and State, in order that the paper may be fully and accurately directed to every address.

THE GOLDEN ERA TO CLUBS.

Parties (living remote from localities where agents are located) forming a club of five yearly or half-yearly subscribers, and forwarding the subscriptions (by letter registered and postage paid) to the office of publication in San Francisco, will be entitled to an additional copy of The Golden Era for the term of one year, or to retain the equivalent in cash.

AGENTS in every part of the State receive subscribtions for the Golden Era.

POSTMASTERS in California, Oregon, and neighboring Territories, obtaining subscriptions for the Golden Era and forwarding the same, with name and address of the subscriber, will be allowed a commission therefor.

PARTIES residing in localities where no Agents are established will forward their subscriptions by mail.

SUBSCRIBERS will be careful in writing as plainly and fully as possible, the direction of papers to be sent to any part of California, the Atlantic States, or elsewhere.

Now is the Time to Subscribe.

TO ADVERTISERS!

Best Advertising Medium—The "Goldea Era" is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village, and mining and agricultural precinct in California, and offers unusual and unequaled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

GOLDEN ERA POSTAGE.

Postage on the GOLDEN ERA, to Mail Subscribers, in California and throughout all the States and Territories of the Union, per quarter, (3 months).... 5 cts. To be paid quarterly, in advance, either at the Office of Mailing or Delivery.
Postage on the GOLDEN ERA, Single Copies, transient, to be prepaid by stamps..... 2 cts.
Postage on the GOLDEN ERA, to Mail Subscribers in the county (San Francisco) where published..... Free.

Golden Era Building,
543 Clay st., near Montgomery, San Francisco.

For Secretaries' Reference.

Safe Rules for Advertising.

Make your order levying the assessment on any day except Friday, and advertise the Assessment Notice on the first four succeeding Saturdays, setting the day for delinquent advertising on the fifth Saturday, and the day of sale on the seventh Saturday, or any day thereafter, previous to the eighth Saturday.

Advertising in the Interior.—If the mine or works of the corporation are located in any State or Territory of the United States, notice must be advertised there also, if a newspaper is published in the same county. On this account, Saturday is the best day on which to levy assessments, as thereby the longest period possible is gained for transmitting a copy to interior papers, which are usually published on Saturdays.

Postponements.—The date set for advertising delinquent stock, and the day of sale mentioned in either notice, may be *once* postponed for any period not to exceed ten days. Secretaries can avail themselves of this privilege when assessments are levied on Friday and they are obliged to advertise at the mine on Saturday, or desire to publish on that day at the place of incorporation.

Errors, Omissions, or Delays are definitely provided for in Section 14 of the new law, whereby it is plain that, if the advertising is delayed, the Secretary can only fix the dates for delinquent advertising and sale to suit the time he is to advertise, and proceed anew.

When Payable.—It is the usual custom to make the assessment "payable immediately," or upon some date within a day or two from the time of levying the assessment, although the law makes no requisition as to this matter.

Blanks Furnished Free to advertisers in the Mining and Scientific Press, for Assessment Notices, Delinquent Sales, Postponements, etc.; also copies of the Assessment Law of 1864. Copies of advertisements, for sending personal notice to shareholders, printed at $1 per hundred.

The Press is the most economical advertiser for stockholders, reliable and obliging for Trustees and Secretaries, and merits the patronage of the mining interests.

Now in Its Tenth Volume!
—THE—
Mining and Scientific Press,
—THE MOST—
Profitable Newspaper
—FOR THE—
Readers of the Pacific Coast.

Issued Every Saturday Morning.

DEWEY & CO., Publishers.

Our Journal enters its Tenth Volume with marked prosperity and improved facilities and resources for furnishing a handsome, valuable and well filled sheet.

We believe that the Press furnishes more information of ready application and intrinsic value to its readers than any other journal on this side of the Continent. Its circulation has doubled during the past year, and, for the economy and interests of the industrial classes of this and neighboring States, its subscription list should be more than trebled for the ensuing twelve months.

We shall continue to make the Mining and Scientific Press substantially

An Instructor to Prospectors,
An Economist to Millmen,
An Assistant to Active Miners,
An Economizer for Mining Advertisers,
A Reliable Reporter for Shareholders,
A Faithful Monitor for Stockdealers,
An Intelligencer for Mechanics,
An Incentive to Inventors,
A Reflector for Patentees,
And a Helpmeet to all Industrial Classes
Upon the Pacific Coast. We shall give accurate and frequent

THE SHAREHOLDERS' DIRECTORY

Will comprise a record of all Notices of Meetings of Mining Companies, Notices of Assessments, amounts levied, date of advertising sales, and day of sales, announced in all advertisements appearing in the San Francisco papers during the period of the Volume.

FOR SENDING ABROAD.

As a paper for mailing regularly to your friends in the East or to correspondents elsewhere, none can be selected more appropriate, or better calculated to disperse reliable information with regard to transpiring events on this coast and the progress of California.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

Friends pleased with our efforts in the publication of the Press can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

SUBSCRIPTION IN ADVANCE.

One Year, (two volumes)..... $5.00
Six Months, (one volume)..... 3.00

FOR ADVERTISING

Our terms are very reasonable. Mining Companies are especially favored by our rates, and careful attention is given to the publication of Mining Notices.

VISIT OF BRITISH OFFICERS TO OUR ARMY BEFORE RICHMOND.—COMPLIMENTARY NOTICE.—Two British officers, who served with high distinction in the Crimean war, one of them now commanding a regiment at Quebec, having lately returned from a visit to our armies before Richmond, have given most satisfactory reports of their observations. They speak of their visit to our armies as the most instructive in their military experience. The works of defence and attack are regarded as constructions of the highest science, and are equal to any in the world. These officers are astonished at the achievements of such vast and perfect military organizations by a people who, four years ago, knew nothing of war. The *morale* of the army, as compared with that of European armies, was a matter of admiration. In their armies, when in the field, the camp followers are more numerous than soldiers, and drunkenness among the soldiers was an evil which no precaution could prevent. They remarked that they saw not a soldier under the influence of liquor, or a place where liquor could be obtained. They conversed with the private soldiers and found them not, like European soldiers, mere automatons, but intelligent as to the policy and plans of war. They were peculiarly impressed by the high tone of the officers, whom they regarded as comparing most favorably in intelligence, culture and courteousness of manners, with those of the best European armies.—*Wash. Chronicle, Nov.* 28.

ANOTHER SUBSTITUTE FOR COTTON.—A new substitute for cotton is thus referred to by a Paris correspondent: "Great excitement prevails in those manufacturing districts of France where cotton is most used, on account of the discovery of a substitute for the now dethroned king. This substitute is the China grass, or white *urtica*, (nettle weed,) which may be cultivated cheaply in all parts of France. The experiments with this new textile have been going on for over a year or more, under the direction of a competent committee appointed for that purpose by the Chamber of Commerce of Rouen, and this committee, with the weed the raw fiber, and various specimens of woven, and colored and uncolored cloths in hand, have shown the Chamber, beyond all questions, that the substitute is a genuine one in every point. They declare, without a reservation, that none of the qualities of the cotton are wanting. I commend to your attention the lengthy report as published in two late numbers of the *Moniteur*. The Minister of the Interior is furnishing seed, obtained from China, to agriculturalists, and the speculation is going to assume, at once, colossal proportions.

A LARGE SHIP.—The ship "Norway," from New-York, discharging her cargo at Vallejo street wharf, is the largest ship which has ever entered this port. She is 3,500 tons register, and will carry 500 tons more of freight than the ship "Great Republic." She carries a superb engine on board for the purpose of hoisting out her cargo, which has sufficient power to work five pumps, in case the ship should spring a leak at sea. She belongs to Messrs. Tress & Dearborn, of New York.

OUR armies carry our institutions with them, the printing press, free schools, and railroads. A railroad now runs along the whole battle line of GEN. Grant's army, with one terminus in the outer chain of fortifications.

For Advertising Assessments on Saturdays.

Levy your Assessments upon any day EXCEPT FRIDAY.

Advertise the ASSESSMENT NOTICE on the FIRST FOUR SATURDAYS succeeding the day upon which the assessment is levied.

Appoint the day for advertising the DELINQUENT SALE on the FIFTH SATURDAY succeeding the date of levying the assessment.

Appoint the DAY OF SALE on the SEVENTH SATURDAY succeeding the date of levying the assessment, or any day *previous* to the Eighth Saturday.

Assessments ordered upon Saturday allow the Secretary the longest term in which to effect his advertising on the mine.

Extracts from the Statutes.

The attention of companies who desire advertising their delinquent sales in any other paper than that in which the notice of assessment appears, is called to the following section of the law approved April 4th, 1864:

Section 7. If any portion of the assessment mentioned in said notice shall remain unpaid on the day specified therein for the publication of the notice of sale, the Secretary shall, *unless otherwise ordered by the Board of Trustees*, cause to be published in the same papers in which the notice provided for in section five shall have been published, a notice substantially as follows, &c.

If, from a matter of convenience or necessity, the publication of an assessment is delayed, a very simple remedy is found in the following section of the law, relating thereto:

Section 14. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the nonperformance of any act required to be performed in order to enforce the payment of the same; but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall be void, and publication shall be begun anew.

To Mining Secretaries.

We positively refuse hereafter to receive advertisements of any mining company for the payment of which the Secretary is unwilling to vouch. We shall also exercise the right to eject from our columns, at any time during the course of publication, any advertisement for which payment is not made, or security given upon proper notification.

A Geological Examination.—Mr. J. E. Clayton, a geologist of considerable prominence, is now making a geological examination of our country. He has been lately in the Humboldt section as an assistant of Professor Silliman. A correspondent of the San Francisco Bulletin thus speaks of him:

As a field geologist and mining expert, Mr. Clayton has no superior on this coast, and it would probably have been worth something to this region if the mines here were opened sufficiently to warrant him in expressing a more unreserved opinion of their merits. As it is, he pronounces several of the ledges here to be regular fissure veins, carrying heavy masses of the most valuable ores, and as bearing the indications of permanency. Upon these he thinks money might be spent to advantage; though there are hundreds of others that he would advise no one to touch—an opinion that very many miners here seem disposed to concur in.

Coal Dust.—There is a company organized in this city to manufacture fuel out of the dust of coal. They have discovered a process by which the dust is formed and kept in a solid compact mass, and their experiments prove it to be a very valuable fuel. It burns freely and thoroughly, and gives out as much heat as solid anthracite. The coal dust, we understand, can be purchased at the mines, where there are immense quantities of it hitherto unused, for the small price of forty cents per ton if sifted, and it is estimated by the very intelligent persons engaged in the enterprise, that a ton of solidified coal dust can be sold at from four to five dollars.—*Philadelphia Bulletin.*

A Miner on a Strike Starved to Death.—The Birmingham correspondent of the London *Engineer* says:—"An inquest was held last week on the body of a miner who had been on a strike, and who had for some time preceding his death been on a short supply of food, and had to sleep in the open air for eight consecutive nights. A verdict of 'died from cold, exposure, and want of sufficient sustenance,' was returned."

While filling the reservoir of the Charlestown, Mass., water works, a few days since, the pumps would not operate, and an examination proved that the pipe was completely filled with eels. The next day the trouble occurred again, and on the two occasions over 2,500 pounds of eels were removed.

The Indian names of some of our new war vessels are thus interpreted; Suwanee, buffalo soup; Shamokin, wood-out pipe; Muscoota, muskrat; Winnepec, small pig; Ashuelot, burned bones; Monocacy, sleeping baby; Mahongo, wounded bear.

W. W. Wade, of the Amoskeag Gun Works, Manchester, has perfected a breach-loading rifle which throws fourteen bullets without reloading. The piece weighs only eight pounds.

Rich Quartz.—The Victoria *Colonist* mentions that a miner has struck a quartz lead on Wolf Creek, Leech River, for which he has refused ten thousand dollars.

IMPORTANT DISCOVERY
— IN THE —
Photographic Art.
Jacob Shew's
CHROMATIC PROCESS OF PRINTING PHOTOGRAPHS.
[PATENT APPLIED FOR.]

THE UNDERSIGNED WOULD ANNOUNCE TO THE public that he has discovered a new and IMPROVED PROCESS for printing Photographs, which produces a
SOFTNESS, CLEARNESS AND DELICACY OF TONE
unattainable by any other known process and to which he has given the above name. It is applicable to any size of Photograph, and those having valuable old negatives which they desire printed by the improved process can do so at any time.
In order to secure the pecuniary advantages to be derived from this important discovery a patent has been applied for. When obtained, the privileges of the right will be disposed of at a reasonable rate to any Photographer desiring it. In the meantime all are warned against encroachments upon the rights of the discoverer as such will be prosecuted to the full extent of the law.
"Cartes de Visite" and large Photographs printed by this process will be furnished at the prices of the ordinary work of other establishments.
☞ The public are invited to examine specimens at my Gallery. ☜ **JACOB SHEW.**

Old Stand, corner Bush and Market Streets. Opposite Oriental Hotel, San Francisco, Cal.

AN UNQUENCHABLE FIRE.—The coal contained in the Brooklyn, N. Y., Gas Company's coal yard took fire from spontaneous combustion on the 9th of January, and soon commenced burning rapidly. Ineffectual efforts were made to extinguish it up the latest date, the 13th. The entire Fire Department of two Districts had been unremittingly at work, by relays, for five days, without making any perceptible headway against the fire. It was supposed that at least $200,000 in value of coal would be consumed. A pile of similar coal at the Boston Gas Works took fire a short time previously and was entirely consumed. The Brooklyn company's coal had taken fire several times previously, but being promptly discovered, was easily extinguished. There were 20,000 tons in this pile.

THE FIRE ALARM TELEGRAPH MATERIAL for San Francisco has mostly arrived, and is being put up as rapidly as possible. The work of stretching the wires through the city has already commenced. There will be three alarm bells—one will be placed on No. 10's engine house, corner of Stockton and Greenwich streets, for the northern part of the city; the City Hall bell will be removed from its present position to the top of the Union building, for the central portion, and the third bell will be placed upon the engine house now being erected on Sixth street, near Folsom, for the southern portion of the city. The bells for the northern and southern districts have been ordered from the East, and will weigh 1,800 pounds each.

THE New York anti-draft riots have already cost that city $1,344,728 for damages, and there are at least $400,000 more which will have to be paid—a pretty dear bill, which might have been promptly nipped in the bud by a little common sense and firmness.

PLACER COUNTY.—The Placer *Herald* states that the rich strike near Auburn continues to engage attention. Several interests have been sold in the claim at large prices, and all the holders are sanguine that the lead is valuable. They further say that the lead is clearly defined, about six inches in width, and encased in wall rock. From Quartz Hill, where this discovery was made, a plainly defined lode runs in a northwesterly direction, and upon it, a mile distant from the Hill, good prospects have been obtained in the croppings, which has caused the lead to be taken up as far as traceable. The *Herald* adds that these discoveries have turned the minds of men considerably to quartz, and just now there are strong promonitory symptoms of a quartz fever about Auburn.

THE "Millerton and Owen's River Valley Transportation and Road Company" have completed thirty miles of their road—from Millerton to King's river—and a line of stages has been placed on the route.

ONE thousand people have starved to death in the Cape de Verdes, and the famine still continues.

A blue and pink mare, and a colt of the same color, are the attraction of a circus in England.

EGYPT will raise about $100,000,000 worth of cotton this year. It will bring her lots of British gold, and will add greatly to her internal wealth.

COPIES OF PATENT CLAIMS.—We will promptly furnish, for a moderate fee, a copy of the *claim* of any patent issued by the U. S. Patent Office since the year 1836, on receiving the full name of the patentee, nature of his invention, date of the patent, and address of the person desiring the information.

SCIENTIFIC AND MINING JOURNAL.—This is an invaluable publication as is produced on the Pacific Coast, and one which interests all parties. It contains much that is instructive and entertaining, and seems to have the right men at the head of its affairs.—*Spirit of the Times.*

Notice.

OFFICE OF THE COUNTY CLERK,
CITY AND COUNTY OF SAN FRANCISCO.

In the County Court of said City and County:

Notice is hereby given, pursuant to law and an order of the Hon. Samuel Cowles, County Judge of said City and County, this day made, that "La Morronena Silver Mining Company," a Corporation organized and doing business in said City and County, has made application, by petition this day filed, that said Company be disincorporated and dissolved; and that such application will be heard by and before the Honorable the County Judge of said City and County, on the 31st day of January, 1865, at 10 o'clock in the forenoon of that day, at the chambers of the County Judge, in the City Hall Building, in said City and County.

Witness my hand and the Seal of said County Court, this 30th day of December, A. D. 1864.

(Seal and 50 cent stamp'd)

HUNT'S IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

E. O. HUNT,

No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

ATWOOD'S Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale, SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating: also, for crushing Quartz for Arastras and Grinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water, or Steam Power. For further information address W. W. HANSCOM,

1 Golden State Iron Works, San Francisco.

DUNBAR'S PATENT SELF-ADJUSTING Piston-Packing.

Requires no Springs or Screws; Is always Steam Tight, without excessive friction, and never gets slack or leaky.

IT WILL SAVE EACH SEASON MANY TIMES ITS COST in friction, time, steam and power. No engine, old or new, should be without it. It can be easily fitted to old or new Pistons.

Having obtained the Agency of this VALUABLE IMPROVEMENT, I am prepared to furnish it wherever desired. For further information, address HENRY S. SMITH,

23v8 Golden State Iron Works, San Francisco.

HUNT'S NEW DITCHER.

HAVING SECURED FROM THE INVENTOR THE SOLE right to manufacture these Machines for the States of California and Oregon, and the Territory of Washington, I am now prepared to receive and promptly fill orders for these machines.

With the aid of three men and four horses this Machine will cut a ditch from two to three feet deep, as may be desired, dumping the earth all on one side so as to form a dike or embankment. For particulars send for circular, to

THE NOVELTY.

This ROTARY CYLINDER GRINDER & AMALGAMATOR *did not receive* the premium at the Industrial Exhibition. The one there displayed worked one hundred pounds at a charge, and was classed merely as a model, honorable mention of which being made by the committee. The inventor is now manufacturing some of the larger size of this machine, capable of working Two Thousand Pounds at a charge, and requiring no more power than is necessary for the pans now in use working but one-third that amount. This machine is simple in construction, durable and compact, very easy to clean up, and, in fact, is a perfect machine.

In offering his Amalgamator to the mining public the Inventor does not claim to have found the "Philosopher's Stone," nor any new method of extracting the precious metals from the ores, but does claim, as a practical mechanic and worker on mining machinery, that there was room for improvement in that direction, and that he has, by careful study, invented his improved ROTARY CYLINDER GRINDER AND AMALGAMATOR, known as the "NOVELTY," which mechanically overcomes the many difficulties that have heretofore arisen in the art of amalgamating ores.

This invention consists of a cylindrical-shaped case placed horizontally on legs, and provided with dies one and a half inches thick, making seventeen square feet of grinding surface, and having a rotary oblique muller (one or more) placed within it, and covered with shoes one and a half inches thick, and so constructed that all particles of rock must pass between the shoes and dies, causing it to be thoroughly reduced. The process of amalgamation is similar to that of the German Barrel, but much more rapid than that or any other amalgamator, as the muller gives three distinct motions to the pulp in one revolution. Heretofore, the chief objection to cylinder amalgamators has been the great wear and friction to which the journals were subject; but in this amalgamator that difficulty has been entirely overcome by the use of an adjustable metallic box, a new invention, that acts for the double purpose of a metallic packing and a journal box, and works to perfection.

This machine, when seen working will convince any practical man of its superiority over all others, and the public in general, and Miners and Millmen in particular, are invited to call and examine these machines, now in operation at the Miners' Foundry, where they are now being manufactured. Address, Miners' Foundry, San Francisco, Cal.

H. L. HOPKINS,

10v1 Inventor and Patentee.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. There it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the

PACIFIC FOUNDRY,

10v1 San Francisco.

SALMON'S PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep lub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

No.	Fine	No.	Fine
Assay..... 289	913	Assay 300	991
Assay..... 285	941	Assay for Czotman	989
Assay.....286	940	Assay Water Rock	966
Assay.....291	950	Assay Water Rock	998
Assay.....		St. Helena Ledge, W. D.	966

These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,

To whom all orders should be addressed. 15

Hepburn & Peterson's AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. between 3d and 4th.

Illustrated in the Mining and Scientific Press, April 9th, 864.

HEPBURN & PETERSON.

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled 3 in ng Machines, consisting of his celebrated Turbine Wat r Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast, amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. B. FAUCHERY, Engineer,

9v24

FARRAND'S Oscillating Amalgamator,

RECEIVED THE

ONLY PREMIUM

AWARDED FOR AMALGAMATORS

At the Recent Industrial Fair

OF THE

Mechanics' Institute of San Francisco.

Committee of Awards.

O. BELDEN, O. GONI, W. T. GARRATT, OEO. JOHNSON, H. P. WAKELEE, C. M. RANCLIFF.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY,

W. D. FARRAND, Inventor,

R. L. OGDEN, Agent, SAN FRANCISCO.

S. E. corner Montgomery and California streets.

v9-19

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber is also perfecting a HAND MACHINE for Miners engaged in prospecting, which will work 25 pounds of ROCK at a time, and which will weigh about 125 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15-1m

PRATER'S PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.

San Francisco, April 1st, 1864. 14v8-tf

Disney's Cylinder Amalgamator.

The Cheapest and Best.

DISNEY'S CYLINDER AMALGAMATOR, WHICH HAS recently been introduced to the public, has already been proved a complete success, and can be furnished, at a price cheaper than any other in use. It is simple in construction, and so arranged as to do a large amount of work with the smallest expenditure of power. The proprietor is satisfied that he can do more work in a given time and with a given expenditure of power than any other amalgamator in use. For small companies who desire cheap yet effective machines, none can be more desirable.

It may be seen in operation at the Rail Road Foundry on Fremont street where

A NEW CRUSHER

Is in operation and he can crush and Amalgamate at the LOWEST RATES. Miners and all others interested are invited to call and examine for themselves.

M. DISNEY, Patentee.

San Francisco, June 23, 1864. 1-3m

HIGHEST WATER.—The Sacramento river reached its highest point, for the season, on the 6th iostant, when it stood at 21 feet 8 inches above low water mark. This high stage of water was produced by its northern tributaries, the American contributing but little to the general result. The point of high water in the great flood of 1862 was 24 feet above low-water mark.

INDIAN LABORERS.—The contractor on one of the divisions of the Pacific Railroad, near its eastern terminus, has employed a large force of Indians (Pawnees) as laborers. They are employed without reference to sex, both male and female going upon the works. The contractor says he has succeeded, beyond his expectations, in making them useful. They appear to be quite handy with the pick and shovel.

And in accordance with law, and an order of the Board of Trustees, made on the 10th day of December, 1864, so many Shares of each parcel of said stock as may be necessary, will be sold, at the office of the Company, Room No 9 Mercantile Library Building, corner Bush and Montgomery sts., on Saturday, the 28th day of January, 1865, at the hour of 11 o'clock A. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

CHAS. H. PLATT, Secretary.

Office, Room No. 9, Mercantile Library Building, N. E. cor. Bush and Montgomery sts., San Francisco. ja14-2

Good Return Consolidated Gold and Silver Mining Company, Inyo District, Tulare County, Cal.

A Meeting of the Stockholders of the above named Company, for the election of Trustees for the ensuing year, will be held on Monday, January 23d, at 2 o'clock P. M., at the office of the Company, No. 728 Montgomery street, San Francisco. By order of the Board of Trustees.

2-2 N. C. FRENCH, Secretary.

Kelsey Gold and Silver Mining Company, Kelsey District, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 9th day of January, 1865, an assessment of fifteen cents per share was levied upon the capital stock of said Company, payable on the 10th day of January, 1865, in United States gold and silver coin, to the Secretary, at his office, in the city of San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday the 11th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday the 27th day af February, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By arder of the Board of Trustees.

S. C. GARDNER, Secretary.

Office, No. 512 Battery street, corner of Oregon, San Francisco, California. ja14-1

La Libertad Gold and Silver Mining Company, Cacachillas District, Lower California.

NOTICE.—There are delinquent, upon the following described stock on account of assessment levied on the 13th day of December, 1864, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
E Van Valkenberg	120	10	$7 50
E Van Valkenberg	121	70	17 50
John H Wood	120	5	1 25
John H Wood	127	5	1 25
John H Wood	128	3	75
Peter Blowa	138	10	2 50

And in accordance with law and an order of the Board of Trustees, made on the 13th day of Dedember, 1864, so many shares of each parcel of said stock as may be necessary, will be sold, at the salesroom of Edwards, Olney & Co., No. 626 Montgomery street, San Francisco, on the 28th day of January, 1865, at the hour of 12 o'clock M., of said day to pay said delinquent Assessment thereon, together with costs of advertising and expenses of sale.

WILLIAM VALE, Secretary.

Office, No. 36 Exchange Building, N. W. corner of Montgomery and Washington streets, San Francisco. ja14-2

Mount Davidson Gold and Silver Mining Company, Virginia District, Storey County, State of Nevada.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 11th day January, 1865, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, Room No. 53 Montgomery Block, San Francisco.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 11th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 27th day of February, 1865, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

W. FELL, Secretary.

Office, No. 53 Montgomery Block, San Francisco, Cal.

Mammoth Gold and Silver Mining Company, Silver Mountain District, California.

NEW

PENSION, BOUNTY AND BACK PAY AGENCY.

The Proprietors of the MINING AND SCIENTIFIC PRESS have established an Agency for prosecuting claims against the United States Government for Pensions, Bounty, and Back Pay.

Discharged Soldiers, and heirs of Deceased Soldiers, will find it for their interest to call upon us for any information relating to the above, as our facilities for preparing the proper evidence, and for collecting claims, are such as will invariably secure prompt returns.

Room No. 11 Government House, Corner Sansome and Washington Streets, San Francisco.

Office of the Mining and Scientific Press.

C. W. M. SMITH,

9v25 **Solicitor.**

Illegal Advertising!

We notice many Secretaries are having their notices of delinquent sales published *weekly* in a *daily* paper. As this is a plain violation of the new law we feel it our duty to warn such parties of this error, and herewith appeud that section of the "Act Concerning Assessments upon the Stock of Corporations," which goveros the publication of deliuquent notices.

Section 9. Said notice, when published in a daily or weekly paper, or in both, shall be published as follows: When published in a daily paper, the same sball bc published for a period of ten days, excluding Sundays and holidays, previous to the day of sale. When published in a weekly paper, the same shall be published for two weeks previous to tbe day of sale, the first publication in the weekly being at least fourteen days prior to the day of sale.

By the above extract it will be clearly seen that no delinqueot stock can be legally sold by advertising in a daily paper, unless the notice is ioserted *daily*.

KELLOGG'S PATENT

IMPROVED NEWBURY

PRINTING PRESS.

This New, Cheap, and most Desirable

JOB PRINTING PRESS

Can now be seen in operation in San Francisco, at the office of the MINING AND SCIENTIFIC PRESS, corner of Washington and Sansome streets.

Kellogg's Improvement

is the addition of a very simple, but ingenious and effectiva method of self-delivering of the cards or printed sheets from the Newbury Press.

It costs less, weighs less, and prints faster than any of the ordinary Job Presses now in use. Any Journeyman or Apprentice, who understands working the Washington hand-press, will have no difficulty in operating this machine.

As a Cheap and Simple Press, for small Printing Offices in the interior, it highly recommends itself.

Address, **L. M. KELLOGG.**

October 29th, 1864. San Francisco.

Bids for Contract.

Bids far contract to take out from Fifty to One Hundred Tons of Ore, from the claim of the ROSE GOLD MINING COMPANY, in Gentry's Gulch, Mariposa County, will be received. Said ore to be taken from a shaft on the claim, and from a level of eighty feet below the surface. Inquire of or address **A. BUETELL,** Secretary.

Office, No. 624 Market street San Francisco. 25-4

ON THE REMOVAL OF STAINS FROM SILK.—Being anxious to discover some means by which the color could be restored that had been extracted from a violet silk dress by acid juice having been accidently thrown upon it, I applied to more thau one chemist aud druggist, thinking there uiost be some chemical agent which would restore violet, as spirit of hartshorn, it is well known, will restore black.

Not being able to obtain any information on the subject, I thought of trying some experiments for myself; the first proving successful may be worth recording, if only to amuse the more learned with an account of the simple attempts of au amateur.

Having recently superintended the "iodine process" for anuihilating a blot of marking-ink from linen, it occurred to me to try it upon the violet silk; the plan I adopted is as follows, and will serve as a receipt: Brush the portion of fabric with tincture of iodine, then, after a few seconds, well saturate the spot with a solution of hyposulphite of soda, and dry gradually; the color is perfectly restored, and I consider my experiment highly satisfactory.—*London Philosophical Journal.*

A party of live Yankees in New York have started a company, with a novel enterprise in view. They propose to have a fleet of vessels employed in following in the wake of our blockading squadrons, to pick up the stray cotton and other merchandise which the blockade-runners throw overboard in the extremity of a chase by the Federal cruisers.

GEN. Grant says he shall not write his official account of his march and fighting from the Rapidan to James river, until he takes Petersburg and Richmond.

THE Government has appointed agents to buy Southern products, on Government account, at Memphis, New Orleans, Nashville, Norfolk, Beaufort, Port Royal and Pensacola.

The highest genius never flows in satire, but culminates in sympathy with that which is best in human nature, and appeals to it.

French agriculture employs more than 10,000 portable steam engines, a force of about 50,000 horse power, equivalent to the work of nearly 100,000 horses.

MINING COMPANIES and others connected with the Mining Interests of California, will find all possible desired information in the *Mining and Scientific Press* of San Francisco which is an ably edited Journal, smartly handled, and well up to the times. The Mining Companies of California, are awake to the advantages of having their Mining Notices, comprising Assessments, Dividends, Elections, &c., concentrated in the advertising columns of one Journal, as we notice in the issue of the *Press* of May 7th, there are no less than seven pages of this interesting matter.—*U. S. Mining Journal, Railroad and Financial Advertiser, New York.*

BOUND VOLUMES READY.—Bound copies of Volume VIII of the MINING AND SCIENTIFIC PRESS, duc the following honorable gentlemen, are now ready, and will be forwarde on receipt of their orders for the same:

Honorable Seth Martin, Nevada.
" R. A. Clark, Onion Valley, Plumas.
" J. P. Rhodes, Sacramento.
" A. A. Smith, Nevada.
" E. H. Snyder, Placer.
" O. P. Stidger, Nevada.

Give us directions how to send them, gentlemen.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

To the Public, and to Millmen in Particular.

As Thomas Varuey has not, up to this date, withdrawn his notice in the "Mining and Scientific Press," in which appears the following language:—

"All persons are warned against purchasing machines made at the Miners' Foundry, called 'Wheeler's Amalgamators,' as they are an infringement on my patent, and a suit is now pending in the United States Circuit Court, against the parties infringing;"

In justice to myself I am compelled to give to the public a statement of the facts in the case, and show the position which Mr. Varney and myself occupy as Pateotees. He commenced suit against me, and the Miners' Foundry, for $90,000, about the 1st of March 1863, and threatened suit against any and all persons who should buy my amalgamators, thus greatly damaging my business. To show the injustice of this suit against a "poor hard working mechanic," I will quote from the opinion of Judge Hoffman, as rendered in the case last November. He says:

This is an action for the infringement of a patent issued to the plaintiff on the 16th of December, 1862, for an "Improvement in Amalgamators for gold and silver." The machine alleged to be an infringement has also been patented—the patent being dated December 8th, 1863. The defendants deny the alleged infringements, and the novelty and originality of the plaintiff's invention. They have also given notice, under the statute, of various other defences, hereafter to be noticed.

Models of the two machines were exhibited in Court, and a large number of witnesses called to explain their construction and mode of operation. It is apparent that the patented machine of the defendant closely resembles, if it be not substantially identical with, the improved and modified machine now manufactured by the plaintiff. But the inquiry is not whether Wheeler's machine resembles that lately used by Varney, but whether the former is substantially the same as the machine described in Varney's patent. That Varney has, in many important particulars, modified the machine as described in his patent, is obvious. Indeed, his late machines resemble much more nearly in external appearance, and in their mode of operation, the Wheeler patented machine than they do a machine constructed according to the drawings and specifications of his patent.

After describing Mr. Varney's pan and its operation, the Judge says:

It appears, however, that the idea of working ores in a batch, by causing them to pass repeatedly between mullers, the upper one of which is provided with openings at the center, is by no means novel.

J. E. Clayton testifies that, so long ago as 1845, he arranged a machine in Tallahoosa, Alahama, for the reduction of gold ores, which embodied substantially the same principle.

* * * * * * *

In Overman's Metallurgy, p 267. a similar arrangement is described. * * * It is evident that the author is here describing an existing and well known machine, the usefulness of which has already been ascertained.

It is also apparent that the result aimed at is the same in this machine as in that of the plaintiff, and that the means adopted to accomplish it are substantially similar. In both machines the pulverization of the ore is effected by means of a bed plate upon which a muller rotates, with central openings to permit the pulp to pass continuously and repeatedly between the grinding surfaces until the operation is completed.

Amongst other things the Judge quotes the following from Judge Story:

But in all cases where the patentee claims anything as his own invention in his specification, Courts of law cannot reject the claim, and if included in the patent and found not to be new, the patent is void, however small and unimportant such asserted invention may be.

* * * * * *

Here the plaintiff claims a particular position of machinery as his invention, and it clearly appears in evidence that the position is not new. It has existed before—not in machines exactly like the present, but in machines applied to analagous purposes, viz: in machines applied for the same purpose as the plaintiff applies them. The objection therefore, is fatal.

In the defendant's machine, the pan in two parts, provided with flanges, packing, &c., to which the plaintiff in his patent attaches so much importance, is not used, but a deep pan is substituted with a wooden cover.

The arrangement of the slots or shoes on the muller is different. The upper muller is provided with spiral ridges arranged to operate with similar ridges reversely inclined on the inner surface of the pan, to raise the pulp and promote the circulation. The upper muller is attached to the shaft by an universal joint, and by a mechanism quite dissimilar to that described by the plaintiff. And for the scrapers are substituted broad guide plates extending and secured to the edge of the pan, and capable of being elevated or depressed by means of a mechanism not found in the plaintiff's machines.

Assuming then—as in the point of view in which we are considering it we must—that each of the several parts of the plaintiff's machine is old, and not separately patentable, it seems clear to me that if the patent for the machine can be sustained, as for a new combination; which I think doubtful, the combination of the defendant is at least as novel as that of the plaintiff.

We have already seen that the muller rotating upon a bed plate, with central openings, and arranged in a pan so as to create a circulation of the pulp, is not a new invention. The tub, composed of two parts, with flanges, packing, &c., is not claimed to have been used by the defendant. In fact it is now discarded by the plaintiff, and a deep pan, with muller attached by an universal joint, has been adopted by him in his later machines. The infringement, if any, must consist in the use by the defendant of the scrapers described in the plaintiff's patent.

The inquiry thus arises—are the curved plates described in Wheeler's patent, substantially the same in their structure and operation as the scrapers of the Varney patent, and if so, do the latter constitute a "material and substantial part of the things patented by Varney, distinguishable from the other part." To determine this question, a brief description of Wheeler's machine is necessary.

The Judge then describes the Wheeler pan and the Varney pan and scrapers, and says:

In the Wheeler pan four plates are used while Varney employs only two scrapers. The form or curve given to these plates in both machines is similar, though not identical; but in their structure, arrangement, and the use for which they are intended, there is an essential difference. The scrapers of Varney are represented as of inconsiderable width, and extending from a ring at the center to the periphery of the muller—they rest apparently upon the surface of the muller, and no means of elevating or depressing them are mentioned in the specifications or exhibited in the drawings.

The plates of Wheeler are of considerable width, and attached to a frame suspended from the top of the shaft, resting upon a vertical screw, by means of which the frame and plates attached to it may be elevated or depressed. The plates extend to the inner surface of the pan, where they are secured by slides. The office of these plates, as described in Wheeler's patent, has already been mentioned. It appears to me that the scrapers of Varney neither serve, nor were intended to serve, any such purpose. [Here the Judge gives his reasons for the above opinion.]

For these reasons I am of opinion that the curved plates of Wheeler differ from the scrapers of Varney in their form and arrangement, their object and effect, and that therefore their use is not an infringement of Varney's patent.

Much testimony was taken to show that in fact Wheeler's invention was prior to that of Varney's and that the latter derived his ideas from the former

It is claimed by Varney that his invention was, in its essential features, matured and perfected in August, 1861. But this statement seems hardly consistent with his declarations or his conduct.

Varney's application for his first patent was not made until the end of October, 1861. That machine has since been discarded as useless.

If then, at the time of this application, he had already matured and perfected the invention of another and far better machine, he committed a practical fraud upon the public in withholding from them the benefit of his skill and ingenuity. It is certainly strange that he should have gone to the trouble and expense of procuring a patent for his first machine, and delayed, for nearly a year, his application for a patent for the improved machine which he had, as he says, already invented.

It may well be doubted whether, if it be true as Varney states, that at the time of his application for his first patent he had already completed and perfected his improved machine, the suppression would not be fatal to both. It appears in evidence that, so early as December, 1861, Wheeler had conceived and communicated to Stewart & Kirkpatrick at Washoe, the idea of his machine. He explained to them the mode in which the circulation, or over and under current was to be produced, and the guide boards by which it was to be assisted.

In January, 1862, drawings of this machine were received at the Miner's foundry, and Stewart, the partner of Churchill, was desirous of having his pans constructed on that plan. The theory and construction of the proposed pan were fully explained to Varney, who succeeded, however, by affecting to consider Wheeler's pan a "humbug," in dissuading the parties from adopting it, and in inducing them to order pans made on the model of his own patent. These were subsequently discarded as useless. We are driven to adopt one of two suppositions: either that Varney wilfully deceived Stewart in inducing him to order an inferior pan, or else that he had not at that time discovered the mode of producing the over and under current, recognized its utility and invented a machine to effect it.

Wheeler commenced manufacturing his machines in January, 1862. He commenced using them in June of the same year. They were constructed at the Miners' Foundry by the defendants to this cause, under the immediate observation of Varney. But in his conversation with Scott, in July, 1862, and in his communications with the defendants, he does not appear to have intimated that he was the first inventor of the Wheeler machine, and that in constructing the latter they were violating his rights. Up to the end of 1862, he continued to have his own pans built at the same foundry; and it be really considered the construction of Wheeler's pans to be an infringement of his own invention, his silence is inexplicable. His delay in applying for his second patent is equally unaccountable. In August, 1861, he had, as he says, completed and perfected his invention of his improved machine, and yet in October of that year he applies for a patent for his first and imperfect invention, and delays his application for a patent for his improved and perfected machine until the end of June, 1862—more than a month after Wheeler had taken the preliminary steps to obtain his patent.

It is unnecessary, however, to pursue this inquiry further, for in the view I have taken of the case the question of priority of invention is immaterial.

The Judge then notices the other grounds of defence, and says:

If this view of the effect of that statute be correct, it affords a defence to Wheeler as well as the other defendants. It is not pretended that he has used any machines not manufactured by them, or that he has infringed the plaintiff's rights, otherwise than by receiving from the other defendants the sum agreed to be paid by them on the sale of his machines.

I find, therefore, for the defendants.

[In this candid statement to the public, I should have preferred to have given the decision of the Judge and the findings of the Court in full, but for the great length of space they would occupy; and I will state that the same can be found in the "Mining and Scientific Press," of December 10th and 31st, 1864, and invite their thorough perusal.]

It will be seen by the above statements that Mr. Varney is infringing on my patent right by the use of wide guide plates in his pans, instead of my infringing on his patent. The truth is, he never used any but narrow scrapers in his pans until after I had put my pans in operation, and they had proved a success. None of his pans made prior to the year 1863 ever run six weeks without being condemned and thrown aside. This may account for the fact that he afterwards altered his patterns and made them like mine, with an open, deep pan, and wide guide plates instead of scrapers, and put a wooden cover on the pans.

Having established my right in my patent Amalgamator, it is now my turn to protect myself against the infringement of "Mr. Varney, or any other man," and I intend to do it; and all persons are hereby warned not to purchase or use machines called "Varney's Amalgamators," as made at the Union Foundry, Pacific Foundry, or any other place, as they will make themselves liable for an infringement on my patent right.

Having made some important improvements in my Amalgamators, the public are invited to call and examine them at the Miners' Foundry, San Francisco, or at Prescott & Schiedel's Foundry, Marysville, where they are manufactured. ZENAS WHEELER.

San Francisco, Dec. 27th, 1864.

Mining Notices--Continued.

Astor Gold and Silver Mining Company, Gold Hill Mining District, Storey County, Nevada,

Notice is hereby given that at a meetiug of the Board of Trustees of said Company, held on the 4th day of January, 1865, an assessment of two dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold and silvercoin, to the Secretary, No. 436 Jackson street, San Francisco, or to E. A. HYNE, Superintendent, Gold Hill.

Any stock upon which said assessment shall remain unpaid on Saturday the 4th day of February, 1865, will be advertised on that day as delinquent, and unless payment, shall be made before, will be sold on Saturday, the 18th day of February, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

EDWARD C. LOVELL, Secretary.

Office, No. 436 Jackson street, San Francisco. 1-4

Agawam Gold and Silver Mining Company, Nye County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 4th day of January, 1865, an assessment of one dollar per share was levied upon the Capital Stock of said Company, payable on the 7th day of January, 1865, in United States gold coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 11th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Friday, the 3d day of March, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

G. M. BURNHAM, Secretary.

Office, No. 509 Clay street, San Francisco. jan7-1-4

Ashland Mining Company, Moss Lode, San Francisco District, Arizona.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 6th day of January, 1865, an assessment of fifty cents per share was levied upon the capital stock of said company, payable on the 30th day of January, 1865, in United States gold and silver coin, to the Secretary, at his office, No. 613 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Monday, the 30th day of January, 1865, will be advertised as delinquent on Saturday, the 4th day of February, 1865, and unless payment shall be made before, will be sold on Saturday, the 18th day of February, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. T. KNOX, Secretary.

Office, No. 613 Montgomery street. jan7-1-4

Blue Ledge Gold and Silver Mining Company, El Dorado County, Cal.

REMOVAL.—The office of the above named Company has been removed to Nos, 8 and 10, Government House.

J. M. BUFFINGTON, Secretary.

Office, Nos. 8 & 10 Government House, corner of Washington and Sansome Streets, San Francisco. jan7-1tf

Bella Vista Gold and Silver Mining Company, Cacachillas District, Lower California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 11th day of November, 1864, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
R S Edgeomb	64 65 66	18	$11 70
John Shirley	134 135 136 137 138 139	54	35 10
J B Lyude	148	18	11 70
H L Chamberlain	125	36	23 40
J P Molt	45 116 47	18	11 70
Godfrey Haigitt	169	10	6 50
W A Dana 75 76 77 78 77		144	93 60

And in accordance with law and an order of the Board of Trustees, made on the 11th day of November, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on the 31st day of December, 1864, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

J. FULLER, Secretary.

Office, No. 326 Clay street, San Francisco. [dec17-21

POSTPONEMENT.—The above sale is hereby postponed until Saturday, January 14th, 1865. By order of the Board of Trustees.

1 J. FULLLER, Secretary.

Animas Silver Mining Company, Ventanas, District of San Dimas, State of Durango, Mexico.

NOTICE.—There are delinquent upon the following described stock, on account of Assessment levied on the 3d day of December, 1864, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
J Fillebrown	8	32	$32 00
J Fillebrown	28	18	18 00

And in accordance with law, and an order of the Board of Trustees, made on the 25th day of November, 1864, so many shares of each parcel of said Stock as may be necessary, will be sold at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on the 20th day of January, 1865, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

RALPH EMERSON, Secretary.

Office, Room 5, No. 540 Clay Street, San Francisco. 27

Great Western Tunnel and Mining Company,
Aurora, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 5th day of January, 1865, an assesment of twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assesment shall remain unpaid on Saturday, the 4th day of February, will be advertised as delinquent, and unless payment shall be made before, will be sold on Monday, the 20th day of February, 1865, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

JOS. C. FORD, Secretary,

Office, No. 21 Exchange Building, corner of Washington and Montgomery streets, San Francisco. jan7-1-4

George Washington Gold and Silver Mining
Company, Silver Mountain, California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 12th day of December, 1864, an assessment (No. 3) of 50 cents per share was levied upon the capital stock of said company, for the months of December and January, payable immediately to the Secretary, or to S. A. HAWKINS, Superintendent, at Silver Mountain.

Any stock upon which said assessment shall remain unpaid on Saturday, the 21st day of January, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 4th day of February, 1865, at the office of the company.

As assesment No. 4 of 50 cents per share, for the months of February and March, 1865, due and payable as above on the 13th day of February, 1865. Any stock upon which said assessment shall remain unpaid on the 14th day of March, 1865, will be advertised on that day as delinquent, and sold on the 25th day of March, 1865, at the office of the company. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.

Office, No. 430 Montgomery street, San Francisco. 25

Gobernadora Silver Mining Company, San
Antonio District, Lower California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 17th day of December, 1864, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable on the 24th day of December, 1864, in United States gold coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on Saturday, the 21st day of January, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday the 4th day of February, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

C. W. HAYDEN, Secretary.

Office, No. 522 Montgomery street, San Francisco. dec24-26-4

Good Hope Gold and Silver Mining Company,
Alpine District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 2d day of January, 1865, an Assessment of fifty cents per share was levied upon the Capital Stock of said Company, payable on the 30th day of January, 1865, in United States gold and silver coin, to the Secretary, or to R. MORRIS, in Markleeville. [*Delinquents will be held for accruing costs after the 30th of January.*]

Any Stock upon which said assessment shall remain unpaid on the 30th day of January, 1865, will be advertised as delinquent on Saturday, the 4th day of February, 1865, and unless payment shall be made before, will be sold on Saturday, the 18th day of February, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

PRESTON MORRIS, Secretary.

Office, No. 526 Montgomery street, San Francisco. [1-4

And in accordance with law, and an order of the Board of Trustees, made on the 8th day of December, 1864, so many shares of each parcel of said stock as may be necessary will be sold at the salesroom of Edwards, Olney, & Co., No. 626 Montgomery Street, on the 23d day of January, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

A. B. WINEGAR, Secretary.

Office, 224 Clay street, San Francisco. 1

Mosquito Quartz Mining Company, Calaveras
County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of December, 1864, an assessment of five dollars per share (one dollar per foot) was levied upon the capital stock of said Company, payable on the 20th day of December, 1864, in United States gold and silver coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on Saturday, the 21st day of January, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 6th day of February, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

G. PARDOW, Secretary.

Office, No. 15 Montgomery Block, San Francisco. dec24-26-4

Our Circulation.—THE MINING AND SCIENTIFIC PRESS has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

New Era Copper Mining Company, Snit Spring
District, Tuolumne County, California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 3d day of January, 1865, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable on the 1st day of February, 1865, in United States gold and silver coin, to the Secretary.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 4th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 18th day of February, 1865, to pay the delinquent assessment, together with costs of Advertising and expenses of the Sale. By order of the Board of Trustees.

C. B. TOWLE, Secretary.

Office, S. W. Corner of Stockton and Washington streets, San Francisco, jan7-1-4

North Superior Copper Mining Company, Union
District, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 22d day of December, 1864, an assessment of forty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary at the office of the Company, No. 338 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the 21st day of January, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 4th day of February, 1865, at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, California, to pay the delinquent assesment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

T. B. SHERMAN, Secretary.

Office, Room 12, No. 338 Montgomery street, San Francisco, California. dec24-26-4

By order of the Board of Trustees.

W. L. KIRBY, Secretary.

Office, Room 8, No. 511 Clay street, San Francisco. dec24-26-4

Important to Secretaries.

Secretaries will please write proper names and figures distinctly, and hand in their advertisements as early in the week as practicable. Our latest forms go to press Friday evening. Any information concerning the requirements of the laws regarding advertisements will be cheerfully given when solicited. Inspect all your notices carefully upon their first appearance. In case of postponement, give the earliest notice possible at the office. When copy is received sufficiently early, a proof-sheet will be furnished if desired. A revised copy rendered for advertising at the mine, when requested. Neatly printed copies of advertisements, for serving individual notice to stockholders, printed at $1 per hundred. Copies of the new advertising law, as officially published, furnished gratuitously. ☞ Blank forms, for filling out Assessment Notices and Delinquent Sales, supplied free to advertisers in the MINING AND SCIENTIFIC PRESS on application at the office.

[The mining community begin to appreciate our reasonable rates of advertising, and are turning their patronage to the journal most properly entitled to receive it. The advantage to shareholders of having all mining notices concentrated in one mining journal, is obvious to all, and our terms have been established with a view to effect such a consolidation; and most companies having an object for publishing in any other particular paper, can consequently afford to have their notices appear in our journal also.—EDS. PRESS.

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alteration, which they may desire made in their advertisements, at their earliest convenience. New advertisements should be sent in as early as possible.

DEWEY & CO., Publishers.

Office, 11 Government House, corner Washington and Sansome streets, San Francisco.

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the MINING AND SCIENTIFIC PRESS. The circulation of tha paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe o be a sensible motto.

Constitution and By-Laws

Mining and Prospecting Companies

Elegantly printed, with care and dispatch, at the office of the

Mining and Scientific Press.

☞ Orders from the interior faithfully attended to. Packages which can be judiciously sent by mail will be prepaid at our expense.

Astonishing Illegality of Mining Advertising.

The amount of mining corporation advertisements now being published in certain daily papers of this city in an illegal manner, and containing plain and gross violations of the recent Act concerning assessments of corporations, is really astonishing.

ADVERTISING IN SUPPLEMENTS has been decided by the Courts of the State of New York (after whose code the laws of California were framed,) as absolutely void; and we have the best of reasons for cautioning every prudent company against that class of advertising. Furthermore, there are continually numberless errors or discrepancies occurring, through MISAPPREHENSION OF THE LAW, on the part of advertisers.

We do not aim to raise unneccessary alarm, but simply perform our duty in admonishing parties interested against the storm of retribution, which is most surely awaiting the success of such companies as are now pursuing informal transactions, whether the same occur through carelessness, duplicity or ignorance.

The original bill for levying and collecting assessments, as first introduced before the last Legislature, we denounced as outrageous; as amended and passed, the Act is obnoxious and cumbersome to the mining community, and is rapidly preparing an enormous feast for the "legal fraternity" of this coast. Although very rigid, the law is no less specific in its main features, and when once minutely understood, its illiberal requisitions are very plain.

Correct blank forms for advertising, and any information desired by advertisers, will be furnished, gratuitously, at the office of the MINING AND SCIENTIFIC PRESS.

Advertising Circular.

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEES and SHAREHOLDERS, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by one half than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, unhammered by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Our rates are uniform as well as moderate. Advertisements will be taken from the forms and printed on slips or as circulars, for sending personal notification to stockholders, whenever desired, at $1 per hundred.

9th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

10th. Blanks for filling out advertisements of assessments or notices of sale are furnished gratis. Our rates of advertising, and any other information desired, will be freely given upon application at the office.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it.

DEWEY & CO.,

Publishers of the Mining and Scientific Press, Nos. 11 & 56 Government House, Corner of Washington and Sansome streets, San Francisco.

INVENTORS AND INVENTIONS.—Let us not cheapen inventions, but be kind to the inventors; beware of killing the goose that lays the golden egg! Many inventors die before the hour of triumph; others falter by the way. Invention is a struggle, a conflict, almost a battle; if the victors are rewarded, the dead are honored and the wounded carefully attended to. Glorify the inventors who succeed; cover with an indulgent self-respect the faults of those who fail; and soothe the last years of the wounded—those invalids of industrial science who have known only the pains of the fight, and always remained ignorant of the joys of victory. —[Ourmas.

TO MINE OWNERS.

REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat, pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

The "Novelty" Amalgamator.

HOPKINS' AMALGAMATOR.

This machine, an illustration of which is hereunto annexed, is more commonly known as the "Novelty Amalgamator." It is constructed upon the cylinder principle, and is, in fact, a Horizontal Cylinder Grinder and Amalgamator.

The invention consists in the employment of a cylindrical cases, placed horizontally on legs and provided upon its inner surface with dies. The lower portion of this case is exhibited in the engraving with its front broken off, so as to show its interior arrangement. A flange will be noticed around the upper portion of the cylinder, with bolt-holes, to which a top or cover, having a similar flange on its lower portion, is bolted when the machine is at work, thus rendering the cylinder perfectly water-tight.

Within the machine, and affixed to a horizontal shaft, is a wheel, with a broad disk, which constitutes a circular muller, also provided with shoes, whose convex surface is formed to correspond to the concave surface of the dies in the interior of the cylinder. In order to give a proper agitation to the pulp and to increase the cutting surface of the grinders, this muller, instead of being so constructed as to cover with its face the entire corresponding face of the cylinder, covers at any given point only about half the cylinder surface. In order to accomplish this the muller is placed obliquely upon the shaft, so that in turning once round its surface is caused to pass over every portion of the inside grinding surface of the cylinder, giving the muller, when revolving, a wabbling motion, such as a wagon wheel would have if inclined from its perpendicular and then caused to revolve on its axle. The face or shoes of the muller may be constructed of any desired width. The shaft is fitted in adjustable metallic boxes, which are allowed a certain amount of vertical play; in the larger machines the weight alone being sufficient to keep the mullers down to their work, while a spiral spring is used in the smaller ones.

One of the features of this machine is the manner of construction of the boxes by which the journals are kept clean and free from wear by sand. The principle of construction is that of the metallic steam piston packing. It appears to thoroughly perform its office of keeping the journals entirely clean of sand. The inventor has taken out a separate patent for this journal box.

The sizes of this machine range from those capable of receiving from twenty to one thousand, two hundred pounds at a charge. It is readily cleaned up, is simple in its construction and as cheap as any amalgamator in use. It requires but little power to drive it. Its peculiar construction assures a thorough mixing of the pulp and consequently a rapid reduction of the sands. Parties desiring further information, are invited to call at the Miners' Foundry, where one of the machines can at any time be seen in operation. See advertisement in another column.

California Produce of 1863 and '64 Compared.—It appears from the *Mercantile Gazette* that the California produce of 1864, of certain leading articles of agriculture, as compared with the yield of 1863, was as follows:—Wheat showed a falling off of 1,120,000 sacks; barley 152,000 sacks; oats 34,000 sacks; potatoes 31,000 sacks; rye 1,900 sacks; beans 30,000. The only article exhibiting any increase was corn, which increase was chiefly from Los Angeles county.

To Correspondents.—"T. McA.," giving further particulars with regard to his water puzzle, is delayed until next week; also, the Trustees' Report of the "Rose Gold Mining Company." Received—A very useful work entitled "The Cottage Encyclopedia," which will be more fully noticed next week.

Baron Liebig has announced his intention to make the city of London his future place of residence. He will occupy an important position in the company about being organized in that city for utilitizing the city's sewage.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

A Copper Mining District in Oregon.

THE MINES OF JOSEPHINE COUNTY.

Let us speak now of the mines of Josephine county: The greater part of the uplifting of this country belongs to the transition period between the liasic and oolitic formations—immense strata of trappean rocks prevailing. It would be difficult to give a name to these rocks which are passing one into the other; however, on the surface there seems to prevail a species of greenstone, cut by layers of schistose serpentine, which calcareous substances have greatly altered. The copper is found among eruptive rocks, such as the schistose and basaltoid diorites, passing sometimes into sienites, amphiboles, talcose-schists and very often into aphanites. These igneous rocks are sometimes varied by quartz and by white fluorspars, especially near the vein of copper. Not far from the copper deposits are found granites, porphyries and sandstone. We find there also argillous schists and crystalized limestone. The vein runs N. N. W. upon a spur of the Siskiyou, whose axis it follows at the height of about 600 feet above the valley of the Illinois, so that this mine can be worked entirely by tunnels.

THE QUEEN OF BRONZE.

This vein is indicated by beautiful and numerous gossans strongly impregnated with carbonate of copper. Several small preliminary prospectings were opened on the line of gossans, and all disclosed the presence of the vein. Afterwards there was opened the first shaft in the vein itself. It is forty feet deep. The lode was struck at twenty feet, where is found the top of the vein about six feet thick, well enclosed in its walls, and capped with gossans. Lower down is a considerable quantity of red and black oxydes, blue and green carbonates of copper, especially erubescites, containing thirty to sixty per cent. of copper. Blocks of erubescite are found so large that it is necessary to break them by blasting.

Four hundred yards from there is the point where the vein has been attacked in earnest. At first, a large trench was opened, which, at four feet below the surface, beautifully exposed the top of the vein, fourteen feet thick and formed of copper pyrites.

A shaft has then been sunk into the vein between its walls. The descent was perpendicular up to thirty feet, there the vein took an inclination of forty-five degrees for twenty feet more, and then plunged anew.

In these different phases, the lodes of copper pyrites kept always parallel to one another, and at an inclination of forty-five degrees, so that at the point where the vein plunges definitely, the metallic lead is in its natural position, and has kept it to the depth of ninety-three feet, to which point the work had reached at the time of our visit. Dr. D'Heirry regards this slight perturbation as the result of a pressure of hard rocks. We are not of this opinion. The vein, being evidently of igneous origin, and not finding, at the time of the uprising of the matters in fusion, sufficient resting place along the declivity of the mountain, spread over the half opened rocks, and was covered up again, afterwards, by the falling debris of the upper part. The reasons which induce us to adopt this opinion would be too long to develop at present.

The vein is inclosed by eruptive rocks and is separated from them by schistose chlorite, more or less metamorphosed, and of a variable thickness. The vein stone of the copper pyrites is double; it is formed in one part of quartz and fluorspar, which mix readily in a small quantity with the ore, and in the other part, it is formed of a schist, generally soft, which derives its black color from the amphibole. The veinstone of the oxydes is argillous and ferruginous.

The thickness of the vein is from fifteen to twenty-five feet, and the lead of solid copper pyrites, varies in thickness from six to eight feet. Little ore is mixed with the veinstone. We noticed near the shafts, about 400 tons of No. 1 ore, while there was not six tons of No. 2. The copper pyrites yield upon the top of the vein 15½ per cent., at 30 feet deep, 18 per cent., and 20 to 22 per cent. at the point to which the works have come.

This ore is perfectly free from all detrimental substances, such as antimony, arsenic, &c. The following is an analysis which we have taken from the book of the laboratory of Dr. D'Heirry.

Copper	18.00
Silica	8.00
Alumina	50
Sulphur	34.50
Iron	32.00
Fluate of Lime	5.00
Carbonic acid, Oxygen and Water, etc	1.00
Loss	90
Total	100 00

While the work which we have just described was being done, a tunnel was opened 100 feet lower down, to strike the vein at right angles. This tunnel is 238 feet in length. It is a solid and excellent work. The shafts and the tunnels were but a very short distance from one another. In fine, to conclude, we consider the Queen of Bronze as being a permanent vein of uncommon wealth and richness. We believe that the vein will descend perpendicularly as it has commenced; and besides, we must say that the works have been conducted with an skill, prudence and economy, rare in this country.

PROPOSED REDUCTION WORKS.

We will say nothing of the projects of Dr. D'Heirry relative to the reduction works, as this part of his labors will not commence until spring; but the explanations which he has given to us, in this respect, and what we have seen on the spot, leave no doubt as to success. Thus, for example, there is enough ore extracted to reimburse the cost of reduction works capable of producing twenty-five to twenty-seven tons of copper a month, and the ore in sight in the mine, would suffice, according to our estimate, for eight or ten years of work for the furnaces.

As to the reduction of copper ore, it is no more a question here, than in Germany, England or Boston. Let us remember that it is not the *country* which is an obstacle to the reduction of ores, but the *men*. *We must have knowledge* that is all, and we must have sufficient forethought to ascertain, before commencing costly works, if the cost of transportation, the cost of suitable fuel and of labor, and the richness of the ore give grounds for expecting sufficient profits. It is for want of all these little things, so elementary, and so necessary at the same time, that several experiments have failed. Thus the disappointed have announced, vehemently, the impossibility of reducing copper ores in California, attributing their failure to circumstances and the country, while it is really attributable only to their own imprudence. A good copper mine and works of reduction would yield immense profits beyond doubt, provided everything was under favorable conditions.

Now, it seems to us, that the Queen of Bronze is under those conditions. In fact, the purity of ores and the consequent facility of their reduction; the abundance of these ores; the facility of taking out by the tunnels; the inexhaustible quantity and low price of the fuel; a magnificent water-power, for the blast and crushing; all combined at the same point, seem to contribute to economical working and to success. Moreover, Dr. D'Heirry being a skillful chemist and tried metallurgist, is the very man to make the most of such advantages, and to carry such an enterprise to a favorable conclusion.

A Mining Engineer.

Jacksonville, Nov. 29th, 1864.

A Geologist on His Way to Washoe.—We clip the following from the *United States Railroad and Mining Register* published at Philadelphia:

C. P. Williams, geologist and chemist, of this city, is about to start on a professional mission to Nevada, making the trip one way via the Isthmus and San Francisco, and the other way overland through Utah and Colorado. We expect to favor the readers of the *Register* with special and exclusive correspondence from Prof. Williams, whose letters from portions of the country distant from the route which he is now about to pass over, have hitherto appeared in these columns.

[Written for the Mining and Scientific Press.]

Economy in Assaying.

Messrs. Editors:—It is not pretended that the following suggestions contain anything absolutely new, yet it is hoped they may not be entirely useless to that class of assayers, whose chemical knowledge does not extend beyond the daily practical requirements of their vocation; and especially to those who, by reason of their remoteness from great commercial centers, are obliged to pay a high price for all the material used.

In many offices, as high as fifty cents per pound is paid for nitric acid, pure enough for the purpose of *parting;* and this acid, in which but a small quantity of silver is dissolved, is thrown away after being once used, in consequence of its becoming contaminated with nitrate of soda from the use of salt as a precipitating re-agent. This waste may be in a great measure avoided by the use of hydrochlorie acid, in place of salt, when the silver will be thrown down as a chloride, and the nitric acid will remain pure, provided care be taken not to use an excess of hydroehloric acid. In practice, it is better to allow a very slight excess of nitrate of silver to remain in solution, by which all risk of dissolving gold is avoided, and the nitrie acid is not injured materially. The rationale of the matter is very simple; the hydrogen of the hydroehloric acid unites with the oxygen of the nitrate of silver, forming water, thus: $Ag\ O, N\ O^5 \times H\ Cl = Ag\ Cl, \times NO^5\ H\ O$. It might be supposed that the nitric acid, thus recovered, would be weaker than when first used; on the contrary it is stronger, owing to the fact, that more water is evaporated in boiling the "*cornet*," than is afterwards formed in the precipitation. If the assay has been properly expelled there will be no base metal in the acid. The quantity of hydroelorie acid required is so small that its cost is merely nominal, the trouble is but slight, and the saving effected amounts to over eighty per cent. This method is not so readily applied to the hurried assay of silver bullion, owing to the presence of copper.

While on the subject of economy, a hint in regard to *refining* may not be out of place. In performing this operation in a hessian crucible, by means of nitre, it not unfrequently happens that the crucible breaks, the metal is dispersed among the coals, and is only partially recovered at the cost of much trouble. Even if a black lead pot be placed beneath the other, though it retains the fugitive metal, the effect of the plumbago counteracts that of the nitre, and the operation has to be recommenced. This mishap is usually occasioned by the caustic potassa resulting from the decomposition of the nitre, which attacks the sides of the crucible; it may nearly always be prevented by mixing a sufficient quantity of sand with the nitre, which combines with the caustic potash as it is produced, and forms a beautiful slag with the oxyd of the base metals. This slag is much less liable to retain globules of precious metal than that formed without the addition of sand. None but very ignorant or very needy assayers ever attempt to use nitre in a plumbago crucible for refining, yet where this must be done, it is not less advantageous to use sand, as the rapid destruction of the crucible is more owing to the solution of the silica which is mixed with the plumbago, than to the combustion of the latter. Carbonate of soda will corrode such a pot almost as quickly as nitre.

C. A.

A Paid Fire Department.—The New York *Herald* says that *four* bills will be submitted to the present New York Legislature, for establishing a *paid* Fire Department for New York City. The desire of a change from a volunteer to a paid establishment appears to be almost universal. The calls for the change are nearly unanimous from the members and ex-members of the present volunteer department, the Police department and the Insurance companies.

An "Odd Stick."—A man recently died in Paris who had slept in his coffin every night for seven years.

Professor Silliman in Grass Valley.

Professor Silliman, just before leaving for the Eastern States, made a professional tour to Grass Valley, for the purpose of examining and reporting upon that celebrated mining locality. An intimate and practical acquaintance of many years with the growth and development of the mines of that place, enables us to understandingly endorse all that the Professor has said with regard to them. But we fear that the constitutional weakness which appeared to incline the Professor to speak favorably with regard to nearly all the localities which he visited during his stay among us, will have a tendency to detract much from the actual truthfulness of this particular report. Capitalists and mining shareholders in California doubtless fully understood themselves, and made a profitable investment in enabling the distinguished professor to return to the East with an ample fortune, as the proceeds of a ten months absence. The unlimited confidence with which his reports will be received in Wall street, will ensure to Californians a thousand fold and more in return for their noble generosity. We append a few extracts from his report in regard to the mines of Grass Valley:—

The general reputation of this locality as a gold mining region, is widely known, and well deserved. The gold-bearing veins are there proved, by exploration, to maintain their strength and continuity in depth and extent; the region is, geologically, one of greenstone and syenite, with serpentine on the north. The hills are broad and unbroken by cross-valleys, offering large areas of continuous ground favorable to the operations of the miner. So far as my observations go, in no other district of California or elsewhere, are so many veins of high value grouped together. Some of the best known and longest worked, are the veins on Massachusetts Hill, and at the Allison Ranch, ranging from a few inches to two or three feet in width; but in other parts of this district the veins are from two to three feet to ten feet in thickness. Late observations and explorations have shown that they steadily increase in value as they are opened in depth. Especially is this true of a vein known, generally, as the Eureka, on a hill of the same name; this vein, which has been traced for over two miles, is now opened on the Eureka claim to a vertical depth of 200 feet. In the shaft lately sunk by Messrs. Fricot & Co., at this depth, I found the vein perfectly well developed with greenstone on the south, or under wall, syenite on the upper wall; this vein being nearly vertical and over three feet thick, it is abundantly charged with sulphurets and shows much free gold. Its value is estimated at from $80 to $100 per ton. The value of the sulphurets at their mine are from $150 to $200 per ton, and cover, I am informed, the cost of mining and crushing the quartz. Going south of the Eureka, on the course of this lode, are several other claims of great value, prominent among these is the Burdett, three-fifths of a mile from the end of the Fricot claim. On this part of the vein I obtained many rich specimens filled with plates of gold beautifully crystalized or forming, in some cases, a spongy mass in cavities once filled by pyrites now decomposed. In one place the vein on this ground is over ten feet in thickness. The next set of claims (the Union) carries this system of veins down to Wolf Creek at a point opposite to which another parallel vein is now being worked successfully by the Lucky Company and the Cambridge Company.

It is perfectly evident to any one accustomed to view mines that the productive capacity of the quartz lodes in Grass Valley is manifold greater than their present yield; only a small proportion of the desirable ground having been opened at all, while there is a large area of ground within the same geological formation, all equally promising, which has never been explored.

I consider it by far the most inviting field for the profitable use of capital in mining in California, or on this coast. Its immediate future is full of promise for a large and steady increase of gold. Conveniently situated in a beautiful and healthy country, abounding in wood, water, and skilled labor, easy of access, it stands unrivalled, in my judgment, as a field for speculation and judicious enterprise.

Capital, ever sagacious in selecting its fields of occupation, has already discovered the opening, and is fast flowing in to occupy it. Every geological, agricultural and commercial advantage encourage its advances.

Cochineal.—Insects of the cochineal order are found on the cactus plant in some parts of Nevada.

Mr. Ezra Bull, of Danbury, Connecticut, was so overjoyed at the result of the late Presidential election as to cause his death.

Mining Summary.

CALIFORNIA.

YUBA COUNTY.—A Brown's Valley correspondent of the *Appeal* says that the Sweet Vengeance will not be able to do more than pay expenses until their drifts and shafts are farther advanced. The Jefferson are still improving their shaft and opening new drifts The Yuba Company will soon put up an engine for hoisting, which will be followed by a mill for crushing. The Yuba claim is considered equal to the Pennsylvania or Dameboge. All that it needs is the proper machinery for development. Bustle and activity are now characteristics of the Brown's Valley mines.

The *Express* is informed that rich surface diggings have recently been struck in the town of Brown's Valley. The flat was prospected last summer and found to be rich, but the want of water prevented its being worked. The late rains have furnished an abundance of water, and many claims have been taken up, sluices erected, and the place is said to present a lively appearance. One company after running their sluices two or three days cleaned up, and realized a large and encouraging yield. These new diggings, together with the operation of some half a dozen quartz mills, makes Brown's Valley present a very busy appearance.

The Blue Gravel Company, of Smartsville, recently cleaned up $46,660 from a washing of thirty days. This is the fifth clean up since March last.

From Nevada county favorable reports still continue to reach us. New discoveries are almost daily reported, and the most active mining operations are everywhere in progress. We have a large amount of "clippings" from the local papers of that county, which manifest a most commendable degree of industry in gathering local mining items. An extract from the report of Professor Silliman, on the Grass Valley mines, will be found in another column.

SHASTA AND TRINITY.—The Shasta *Courier* says that the Highland mill, of French Gulch, recently cleaned up $4,000 after a run of nine days. They subsequently cleaned up $2,500 after a run of five days. Good work for a small mill. The only other in the Gulch, the Washington mill, is also reported as doing well. The Mammoth Co.'s mill, the most extensive of the four in the county, is now running with flattering prospects. The lode has been proven by deep shafts and tunnels low down, so that no fears are entertained of a "give out" for many years. The Bidwell & Co. mill, (eleven stamps,) at Greenville, recently cleaned up $2,500, the result of six days' run.

In Trinity, quartz is also looking up, according to the Trinity *Journal*. Work is being actively prosecuted on the Ludwig ledge, and the Copper Creek Company have been unceasingly at work for months. Some very rich quartz has been found in Hay Fork valley. There is undoubted evidence of hidden lodes in the divide between that basin and the Trinity, and many astonishingly rich specimens of outcropping ore have been exhibited from that section. A distinct ledge exists in the neighborhood of Raab's ranch, Trinity river, and in many places the rock develops gold in paying quantities.

THE copper mines of Bolinas, in Marin county, says the Marin *Journal*, are still being worked. The claim-holders have effected a compromise with the land-holders, in which the former agree to pay the latter ten per cent. of the net receipts of the mines—$5,000 being first deducted for opening the mines. The first lead opened was the Pioneer, and is owned by Messrs. Ewing, Culver and Pablo Briones. A shipment of four and two-thirds tons of rock from this claim was made, which yielded, by merchant assay, four, seven-tenths per cent. A subsequent prospect, the rock being taken from under perpetual water, yielded eleven, three-tenths per cent., since which time no work has been done until lately, owing to the difficulties regarding the title of the land upon which the claim is located.

Considerable excitement exists in the neighborhood of the Santa Clara copper discoveries, and many persons have been out through the mines to look at them. The increased excitement appear to have grown out of the fact that the "copper rock" is now supposed to be rich in gold and silver also. One of the ledges is said to be one hundred feet thick—another fifty.

SIERRA COUNTY.—The *Messenger* learns that great work is going on at all the hydraulic mining camps in the region round about Downieville. At La Porte nearly as much ground has been stripped as during the two past seasons. At St. Louis, Judkins & Co., Phare & Emery, McCrary & Foy, Barman & Co., were piping in their claims. Along the ridge as far as Brandy City there has been plenty of water and all the miners were profitably employed. No gold is taken out, as the miners are only taking off the poor surface ground while water is plenty, leaving the lower and richer strata for warm weather when water becomes scarce. The cold change which took place the first of the week reduced the volume of water at La Porte more than half, and operations were suspended with several companies for the time. The Feather River and Northampton companies have done a heavy job of top washing. N. Gaul & Co. Gowell & Conly, Kingdon, Wright & Co., Secret Diggings, and Jones, at Barnard's, still have water.

From over south, quartz mining progresses favorably, but owing to the fear of taxes, we presume, reports of money taken out are not current as formerly. The Hope Company, at Minnesota, continue taking out ore which pays with working in hand mortars. The Union Company, at Unionville, about half a mile below Wet Ravine, are reported to have struck it again rich as ever. Constant work is going on with a number of valuable ledges, too numerous to mention, and upon many others work is occasionally done.

MARIPOSA.—The new Mariposa Mining Company have completed one of the most finished and costly mills on the Pacific coast. It has fifty stamps, cost $450,000, and mill and mine together employ two hundred men. In all, we are informed, this company employs nearly one thousand men at their several mills and mines. At the new mill, which is in the town of Mariposa, they recently struck a very rich pocket in the ledge, from which $125,000 was taken out in a short time.

ESMERALDA.

QUARTZ MILLS AT OWEN RIVER.—A gentleman named Mitchell, recently arrived at Aurora on his way to Owen river, where he was to superintend the erection of two fine quartz mills, the machinery of which is on the road to that region. The mills are the property of New York capitalists, whom Mr. Mitchell induced to invest in the mines of Owen river.

MONTGOMERY DISTRICT.—The weather has been pretty rough in that region, and has, of course, greatly retarded mining operations there. But as most of the miners went there expecting to "rough it" through the winter, they have gone to work in earnest, and will accomplish all that willing men can do. A large quantity of rich rock from several of the best mines in the district, is being hauled and packed down to Munekton & Co.'s smelting and refining works. Some of the sacks which were seen by the informant of the *Union* contained splendid looking ore.

We learn that the Great Eastern and Sheridan Company, on Montgomery Hill, recently struck richer rock than any heretofore found in their mine.

A Spaniard who has had considerable experience in smelting silver ore, is now building a smelting furnace, in connection with Sol. Carter and others.

The Union mill of Aurora has been purchased for removal to Montgomery, Efforts are also made to secure the purchase or erection of other mills in that neighborhood.

Numerous very rich specimens of ore from this district are daily being exhibited at Aurora. A ton of sample ore from Montgomery is now on its way to this city, or soon will be, which will be shipped to England for reduction. It was chiefly taken from the Osceola claim.

REESE RIVER.

The Reese River *Reveille* of the 7th inst. says: The Revenue Company, on Lander Hill, Wm. Adams, Superintendent, are now taking out some of the richest ore ever produced in any country, being, as it is called by Mr. Clayton, geologist, a sponge of metalic and chloride silver. Bodies of almost solid silver of several ounces weight are frequently found. The vein is from eight to twenty inches wide, with a rich streak on the upper side of the lode of from one to three inches thick that furnishes this remarkably rich ore.

A NEW MINING DISTRICT.—The *Reveille* says that Mr. Say has discovered no less than four new mining districts during the past sixteen months in the wilds of Nevada. One of these is called Truckee. It is about fifteen miles from Pyramid Lake, about six miles east of the Truckee river, and about five miles west of the Hot Springs. The leads of the district are large and well defined. Assays of surface rock show from $200 to $350 per ton in silver. Some seven leads have been located, and the discoverer thinks he has all he wants. The specimens of ore that we have seen very much resemble the ores of the Humboldt district. The hot springs referred to are seven or eight in number, and are sufficiently hot to cook eggs, meat, or any kind of food suspended in them in camp-kettles. The new mines are in a range of hills passing near the lower crossing of the Truckee, and the leads are from two to twelve feet in width.

WASHOE.

The Virginia *Union* gives the subjoined mining items:

THE OPHIR COMPANY.—Fresh bodies of water have been struck in the Ophir mine, which has risen rapidly to a great height in the main shaft, despite the constant working of the present inefficient pumping arrangements. We understand, however, that a much heavier pump is soon to be put in, which cannot fail to effectually drain the mine.

THE BEST AND BELCHER COMPANY.—The shaft of the Best and Belcher is four hundred and fifty feet in depth. The hoisting works of this company are of the best kind, and the engine one of superior pattern and make, while all the buildings are neat, commodious and convenient. Their affairs are in a prosperous state, and they are now hoisting from their mine a large amount of valuable ore daily.

THE Mexican Company employs but few men—only some half a dozen in the mine at present, and these have been busy taking out small pockets and corners of rich ore, which were formerly passed by and neglected. Some of this ore is of the best ever taken from the mine, showing native and wire silver in profusion. The claim being only one hundred feet in length, the ledge has been all taken out from the surface down to the lower level, which is some three hundred and fifty feet. In order to work the mine any further, the main shaft will have to be made deeper, and as this would necessarily entail a very heavy expense, benefitting the companies on each side of them as much as themselves, the Mexican company have concluded to wait a while and let some of the rest go deeper.

THE Gould and Curry are now erecting hoisting works of the most powerful description and capacity, over the mammoth shaft which they are sinking on D street. This shaft will strike the Comstock ledge at the depth of 1,500 feet, according to survey, at which depth something extraordinary in the way of mineral wealth may be expected to be developed. We look upon this operation with interest, as decidedly of the greatest importance to the entire State, as well as to Virginia.

THE Savage Company are carrying on their operations with the same energy and activity as ever. The main shaft is sunk to the depth of three hundred and ninety feet, and from it the different levels are run in various directions. Some one hundred and fifty men are employed, and from the lower level ore of a superior quality is being taken out in large quantities. The hoisting works are of the most durable kind, and the engine of a very superior make and finish.

THE Halo and Norcross Company have sunk their shaft to the depth of five hundred and fifty feet, the last portion of which was through solid granite. They now propose running an incline from the bottom of the shaft, following the dip of the granite to the depth of one hundred and fifty feet further, where they expect to find it rich. Their hoisting works are of the best in the State, and everything about the establishment is of the latest pattern and kept in the neatest condition.

THE Challar Company are doing better than ever, in the way of taking out fine paying ore, and in drifting and developing their mine more to the southward. A large body of very rich ore has been discovered, some sixty feet in thickness, and still gradually widening out. The hoisting works, engine, and all the other surface arrangements are first-class, and the Challar is fast assuming the position of one of the leading mines in the State.

THE "Four-twenty" is the name of the claim on the Divide where the huge whim is erected. A span of horses is the motive power which drives these peculiar "hoisting works," and the shaft of this company, we understand, is some four hundred feet in depth, and that it is their intention to sink to the depth of five hundred feet, by which time they anticipate striking it pretty considerably rich.

THE Bullion Company have their operations still actively going forward, and have recently been raising some very fine looking ore, but of what has been or is being done in the bowels of the Bullion mine the outside world is kept sedulously in the most complete ignorance, reporters, and even the stockholders in the Company themselves, not being allowed to go down into the mine. The workmen are not allowed to divulge anything in regard to what is done in the mine, on pain of instant dismissal; but why all this secrecy is a question often asked. Well, it is to be supposed that the Bullion Company know their own business best, or at least endeavor to.

THE Eclipse, Challenge and Confidence mines are going ahead actively, taking out the rich pay ore, as usual, their operations being carried on very quietly and steadily, and with the utmost regularity. Last Sunday, however, a small accident happened at the Confidence mine. A heavy cast-iron "clutch" on the reel shaft, which carries one of the big reels, broke, when the cage, with a heavy car load of ore upon it was coming up, and about one hundred feet from the bottom of the shaft; the reel swung back with great violence, unreeling the big rope and dashing cage and car down to the bottom of the shaft again. Strange to say, neither cage nor car were damaged, not even was the ore spilled out. The damages being so slight, were soon repaired.

[Written for the Mining and Scientific Press.]

Copper Smelting.

MESSRS. EDITORS:—In an *Alta* of a recent date I saw an article from the California *Express* respecting works for smelting copper ore in Genesee Valley, Plumas County. I understand that the Union company have also erected some works at Copperopolis. I have recently heard that the works at Antioch would soon be in operation again. Please give an account of these several works—the form and size of the furnaces and the amount each can smelt in twenty-four hours, the kind and quantity of fuel, &c., &c.

I also noticed your article on page 408 of your issue of Dec. 24th, about the Washoe Smelting Company. Can you inform me if the same furnace could be used successfully for copper?

The object of this communication is to obtain information about the best mode for reducing or smelting copper, in which I am interested. N.

In answer to the above we would refer our correspondent to the article in another column, for all we know with regard to the Genesee Valley Smelting Works, which at the present time, appear more promising for copper than any other similar enterprise now in hand.

We know nothing of any especial value to our correspondent with regard to the smelting operations in Antioch, Copperopolis or Washoe Valley, beyond what we have already given in the columns of the PRESS.

We had intended to have given some extended remarks, in answer to our correspondent "N," with regard to the business of copper smelting; but on consulting with a friend, thoroughly and practically posted in that matter, we have concluded to defer our own remarks on the promise of our friend to furnish a series of articles upon that subject, for the PRESS, the first number of which will appear in our next issue.

IMPORTANT IMPROVEMENT.—The old frame buildings at the corner of Market and Third streets are to be pulled down next month, to make room for a stately *six story* edifice, to be built after the style of architecture shown in the new Cosmopolitan Hotel. The proposed structure will form a marked feature in the progressive improvements of the city, and affords a most unmistakeable index of the direction which its growth is taking. Out of Montgomery, by way of Third street to Howard, and thence toward the Mission the great arterial current of fashion will take its course. While commerce, abandoning Rincon Hill and its water front, to the behests of shoddy, will jump from the foot of Folsom to the foot of Third streets and thence hold its undisputed sway over Mission Bay to the Potrero. This is as it should be. The rounded hills which so distinguish our metropolis should never be swept into the bay; let them stand as proud adornments, covered with elegant mansions, to beautify the queen city of the Pacific and protect her magnificent harbor. What would San Francisco be without Russian, Telegraph and Rincon Hills? The foundations of each have already been sufficiently invaded. Let, at least, that course of questionable improvement be stayed, since we have room enough and to spare, for the most extensive growth that can reasonably be hoped for, without destroying the beautiful topography which nature has bestowed upon us, and wherewith she has sought to protect our noble harbor. By so doing we shall merit the thanks of posterity, and lose nothing ourselves.

NEVADA STATE PRINTER.—Mr. Church, of the Virginia Union, has been elected State Printer of Nevada.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, JAN. 21, 1865.

The money market coutinues easy to first-class horrowers, upon good collateral, nnd rates in Bank rule at 1½ ₱ cent ₱ month. Good mining stocks are still in favor with capitalists at a fair margin from current market value and form the basis of an acceptable security.

Receipts of Bullion from the interior since last Saturday amounted to $900,000, nearly one-hall' of which came from Nevada.

Gold hars have been taken to account the past few days at about 840. Silver ranges as formerly.

The share market has presented no new feature this week, and was characterized by a fair degree of activity. First-class dividend paying stocks maintain their former position and have not shown much variation in price. Most of these claims are looking well and will yield the current month the usual amount of Bullion. The weather in Nevada has been good recently and the ronds to nll the mills are much im proved. No difficulty is now experienced in hauling orcs.

Lower priced stocks have heen tolerably well sustained, although less speculation is apparent than for some time pnst.

City shares, with scnrce an exception, are a shade lower, and dull at quotations.

Legal Tender notes have hecn exceedingly active, and $215,000 wcre sold, advancing from 47 to 48¾c receding to 47½c, seller 30, rallying to 48⅛c and closing at 49⅛c. Seller's option contracts have been very freely offered, under the expectation of higher quotations for gold. The latest telegraphic advices from the East quote gold at 218 on the 19th inst., hut much lower quotations are reported since then.

California Steam Navigation declined from $80 to $78, ex dividend, and is now held at $82. The regular dividends of this Company, for some time past, have heen 2 ₱ cent. ₱ month on par value of 100—$1,000 ₱ share—equivalent to 2½ ₱ cent. on current quotations.

Pacific Insurance is vcry firmly held at $130. This Company havc accumulated assets amounting to $167,442 in addition to their capital stock of $750,000, and regularly declare quarterly dividends of $6 ₱ share. The amount of insurance in forcc Decemher 31st, exceeded $10,000,000.

Spring Valley Water is lower, but in request at 77½ ₱ cent. on amount paid in. San Francisco City Water is offered at 75. State Telegraph fell from $36 (sales) to $33 askcd, ex-dividend.

Omnihus Railroad is inquired for at 109, and North Beach and Mission is held at 105. Thc latter Company paid a dividend on the 2d inst. of ½ ₱ ccnt. on their capital stock.

Savage advanced from $1580 to $1600, fell to $1580, again rallied to $1600, receded to $1585, and closed at $1600 asked. In all, 16 shares were sold. Thc Company arc prosecuting work with their usual activity and encrgy. Their main shaft has attained a dcpth of some 400 feet, and thc lowcr level now discloses a larger quantity of good ore than ever. Another body of 80 feet is soon to he opened. We are informed that the yield of the mine thus far the current month has been sufficient for the payment of a dividend.

Gould and Curry has fluctuated a little this week, opening at $1500, advancing to $1560, rceding to $1520, seller 30, then rallying slightly, again declining to $1520, and closing yesterday at $1500; 38 feet in all changing hands. The receipts of Bullion from this mine for the month of January will amount to about $200,000, and the regular dividend of $75 ₱ foot is anticipated. The mammoth shaft on D street, to strike thc lode at a depth of 1500 feet, is progressing energetically. Ovcr this shnft the Company are now erecting very powerful hoisting machinery, hy means of which operations in the lower levels will he prosecuted, it is believed, with more success nnd lcss expense thnn herctofore.

Chollar has heen actively dealt in, advancing from $1,015 to $1,050, huyer 30, declining to $1,015, buyer 5, and closing at $1,020, within which range 73 fect were sold. The compnny are hoisting and reducing some 200 tons of ore daily, and shipments of hullion this week from the mine will exceed $50,000. The south mine is said to look more promising than ever, and the lode in the 5th level of the north miue also continues to improve, showing some twenty fect iu width of good ore aud dipping to the westward.

Yellow Jacket is in more favor at enhanced rates, advancing from $850 to $910, buyer 30, dropping to $850, rallying to $890, huyer's option, and selling yesterday at $865, at these rates 24 feet were sold. This compnny are hoisting more than 100 tons of good ore daily, but will materially increase this amount as soon as the lowcr level is opened.

Potosi advauced from $650 to $750, upon the succcssful issue of its suit against the Bajazet company—12 feet changing hands. At thc close it was held at $750. A numhcr of mills have been employed for the reduction of the large quantity of ore on hnnd.

Empire Mill & Mining Company has met with no sale this week. The stock is well concentrated, and heing chiefly held for investment, rarely finds its way upon the market. This company, following the examplc of the Gould & Curry and Ophir, have adopted the system of requiring daily reports of their operations at their mine and mills to be forwarded to this city. It is a matter of surprise to us that so simple aud convenient a method for obtaining reliahle and accurate information has not heen universally adopted.

Ophir advanced to $325, declined to $295, seller 30, and closes at ahout $300. Arrangements have just heen perfected with the Mex ican company to furnish the new and powerful machinery of the Ophir to the shaft of the former (now down 425 feet,) nnd hereafter the work of working and exploration is to go forwnrd with vigor and at the joint expense of the two companies. The Ophir has yielded a large quantity of fair ore lately and hoth of the company's mills—upon the Carson and in Washoe Valley—have heen regularly supplied and working to their full capacity. Mr. Wm. Blanding has heen elected to the Presidency.

Uncle Sam has heen actively dealt in, and steadily declined from $180 to $150, advancing to $210—and nssessment of $60 delinquent—within which range 55 shares were sold. Overman was sold at $100 hut is uow lower.

Imperial is much firmer and small sales were made at $128. The body of ore found in drifting east, continues to improve. Receipts of hullion are increasing and a dividend for the month of Jannary is confidently looked for by some stockholders.

Burning Moscow has attracted much attention this week, and 2645 shares were dealt in, receding from $25 to $21, advancing to $25½, cash, and $25 huycr 30, then dropping to $22, and selliug yesterday at $23½@$24.

Bullion has heen active at fluctuating rates, opening at $80, declining to $65, rallying to $75, huycr 30, thcn receding to $55. advanciug agaiu to $75, buyer 30, and closing yesterday at ahout $74. An examination of the Company's hooks has not yet heen thoroughly made.

Bajazet and Golden Era fell from $32 to $5, rallicd to $7½, and closed at $5.

Nevada (J. G.) declined from $32 to $28, and is now held at $42, an assessmeut of $15 ₱ share delinquent.

Sierra Nevada rose from $25 to $40, receded to $37½, buyer 30, and closed at $36 asked. Burnside was sold at $7⅛; Lady Bryan at $7½@8; Real Del Monte at $12; Daney at $14½; Antelope at $32½, and Wide West declined from $11 to $6, rallying to $8½.

The aggregate sales of stocks and Legal Tender Notes since Saturday last amountcd to $435,317.

Authorized Scale of Commissions Adopted by the S. F. Stock and Exchange Board.

Miscellaneous.

Funded Debt, on par	½ per cent
Insurance Stocks, on par	½ per cent
Wharf Stocks, on par	½ per cent
Gas Stocks, on par	½ per cent
Railroad Stocks, on par	½ per cent
Steamboat Co. Stocks, on par	½ per cent
Telegraph Co. Stocks, on par	½ per cent
Water Co. Stocks, on par	½ per cent
Legal Tender Notes and Bonds, on par	½ per cent
Bills of Exchange, on net amount	½ per cent
Mint Certificates, on net amount	½ per cent
Specie, on net amount	½ per cent

Commissions on Mining Shares.

Sale at 1 dollar up to 10 dollars	$0 25 per foot
Sale at 10 dollars up to 25 dollars	50 per foot
Sale at 25 dollars up to 50 dollars	1 00 per foot
Sale at 50 dollars up to 100 dollars	1 50 per foot
Sale at 100 dollars up to 200 dollars	2 50 per foot
Sale at 200 dollars up to 400 dollars	5 00 per foot
Sale at 400 dollars up to 600 dollars	5 00 per foot
Sale at 600 dollars up to 800 dollars	7 50 per foot

From $800 to $3,000 per foot, one per cent, on the amount of purchase or sale.

Anything above $3,000 per foot, three-quarters of one per cent. on the amount of purchase or sale.

FRANK LAWTON, Secretary.

J. B. E. CAVALLIER President.

Mechanical.

A NEW USE FOR PHOTOGRAPHY.

It is only quite recently, we believe, that photography has been applied to re-producing mechanical and working drawings. One of the most successful efforts of this kind which we have yet seen is now before us, from the gallery of Mr. T. J. Higgins, No. 659 Clay street, in this city. This photograph comprises the working drawings of the frame and machinery for a ten-stamp mill, showing the exact position, and in such a way as to admit of accurate measurement of every stick of timber in the frame, of every piece of machinery in the mill, from the "high-pressure water-wheel" by which the machinery is to be driven, down to the small steam pipes and cocks attached to the pans in the amalgamating rooms. We have here a ground plan, a side elevation, and an end elevation, of the mill, with its machinery in place; also side elevations of different portions of the machinery, with scale in feet and inches by which the whole may be accurately measured, constructed and put together.

The whole is shown on a sheet only twelve by fifteen inches in size, and yet the draughtsman has found room for a large sign, distinctly lettered, showing that the mill was planned, and most of the machinery designed, by Wheeler & McAuley, and constructed chiefly at the Miners' Foundry, in this city. A ditch, a quartz ledge, and a deep cañon, is also shown, with car and hoisting gear, and an extended perspective from a hill-side, covered with tall pines, and a distant view, even to the summit of the Sierra.

Mr. Higgins has our thanks for the picture, and as he makes the rough work of a quartz mill and its surroundings look so well we don't know but that we may be tempted to risk our good looks in front of his instrument some day when we get time to wash the ink from our fingers; more especially as we are quite sure that, though he may be able to "take" an editor's face, it will puzzle him, with all his instruments, to take money from his purse. We should feel perfectly safe, and fully "master of the situation," financially, if the instrument should even break in its attempt upon our countenance.

A NEW KIND OF SILVER WARE.—Amid the rage for novelty in New York, they have gotten up a very pretty device, which is designed as a substitute for silver ware. It is a "Boston notion," and is said to look very fine. It is described as follows: "The article is silvered glassware. The glass is made double, and the interstice between is filled up with a silver-like preparation, which, when it cools, adheres closely to the glass, making the inside and outside wonderfully resemble polished silver. As washing the glass only makes the "silver" look brighter, without of course removing any of it from the ware, this glass silver is a desideratum. There are vases, goblets, punch-bowls, tea-sets, salvers, fruit-dishes, lamps, etc., all fashioned in this way, and they glitter like the real thing, though they are no more costly than ordinary glass. So everybody can have pretended silver if they cannot afford real plate. The ease with which the "chasing" can be executed on glass enables them to ornament these articles most elaborately, and the cigar cases, card receivers, boquet holders, etc., are hence rendered very handsome. What shall we come to next? When shall we fail to be able to discriminate between the real and unreal?"

A NEW material for hats has recently been tried at the hat manufactory of James H. Prentice, in Brooklyn, New York—one of the most extensive of the kind in the Union. This material is prepared cork! It is said to be lighter, cheaper, more flexible, and more easy to wash, than any material heretofore used for the manufacture of hat bodies. Competent judges believe it will revolutionize the trade.

AN Irish National Fair, similar to that held in Chicago last year, was to commence in Troy about the 1st of January.

WM. BURR, the inventor of the casemate iron-clad system, died recently at Greenfield Hill, in the State of Connecticut.

To Machinists and Founders.

A gentleman, who signs himself W. P. Williamson, and who writes from Virginia City, Montana Territory, addresses us as follows:

"I wish to purchase machinery for the purpose of extracting gold and silver from quartz, and had thought of going East for the same; but seeing an old copy of your paper, the MINING AND SCIENTIFIC PRESS, I thought, after perusing it, that your machinists might have something better than I could obtain in New York, especially for extracting silver. Will you please to hand this to some of your manufacturers, requesting them to correspond with me?

1st. I wish to know your mode of crushing, weight of stamps, and other castings connected with the battery.

2d. What would be the cost of a battery necessary for crushing four tons, and the other machinery needed for extracting the gold and silver, both minerals being found in the same veins—also the weight of the same?

We have but one three stamp mill, which saves, but imperfectly, the gold, and no silver. What has been run through this mill, however, yields from $200 to $400 per cord (four tons). In most of the lodes silver predominates, assaying from $200 to $1,000 per ton, at a depth of only twenty-five feet.

There is ample water-power here to run any machinery necessary for working the ores. I am not particular about the size of the mill, whether it be of a capacity of four or any intermediate number to eight."

We have taken the liberty to make the letter of our correspondent thus public, partly to impress upon the mining community in our Northern mines that San Francisco is the most advantageous point at which to purchase mining machinery, for the reason that our mechanics here have had more practical experience with regard to the character of the machinery needed for particular work, and partly to advise our readers of what is going on in the extreme northeastern portion of the extensive mining regions of the eastern slope of the Rocky Mountains. Large quantities of mining machinery are now forwarded from this city to Idaho—the Territory next adjoining Montana on the west—and we have no doubt but that machinery can be taken to any point this side of the South Pass cheaper than it can be obtained from New York or St. Louis. The advantage of experience on the part of our California mechanics in the specialty of mining machinery, is beyond question. We trust some of our enterprising machinists will open a correspondence with our friend from Montana. His letter can be seen at this office.

A NEW LOCOMOTIVE.—We made mention, a few weeks since, of a new railroad locomotive invented by Mr. Shankland of Nevada County. A public exhibition of the machine was announced about the time we made the notice; but some accident happened to it which impaired its working, and the exhibition did not come off. It will be seen by the following paragraph, which we clip from the Nevada *Gazette*, that the damage has been repaired:—

SHANKLAND'S LOCOMOTIVE.—We are informed that Mr. D. Shankland has got the working model of his new locomotive for ascending steep grades repaired, and has it now on exhibition at North San Juan. It works quite successfully, and is doubtless an invention of much usefulness and importance. Mr. Shankland will bring it here for exhibition in a few days when the scientific and curious among our citizens will have an opportunity of examining it.

NEW WINE PRESS.—Mr. Campbell, a carpenter of Sacramento, according to the *Bee*, has recently invented a very ingenious wine press, which the editor of that paper thinks is destined to become very useful. A press of sufficient capacity to crush a ton of grapes in a few minutes, will occupy only a trifling space, and can be removed from one location to another by two men. The motive power is of the hydraulic order, the juice of the grape as it exudes, being, by the aid of a hand pump which can be worked by a lad of twelve years, used to give the hydraulic force necessary to produce a pressure of from one to ten tons, according to the size of the press. Application has been made for a patent, and soon this interesting invention will be offered to the public.

The Tools Great Men Work With.

It is not the tools that make the workman, but the trained skill and perseverance of the man himself. Indeed, it is proverbial that the bad workman never yet had a good tool. Some one asked Opie by what wonderful process he mixed his colors. "I mix them with my brains, sir," was the reply. It is the same with every workman who would excel. Fergnson made marvelous things, such as his wooden clock, that actually measured the hours—by means of a common penknife, a tool in everybody's hand, but then everybody is not a Ferguson.

A pan of water and two thermometers were the tools by which Dr. Black discovered latent heat; and a prism, a lens and a sheet of pasteboard enable Newton to unfold the composition of light and the origin of color. An eminent foreign savan once called upon Dr. Wollaston, and requested to be shown over his laboratories in which science had been enriched by so many important discoveries; when the Doctor took him into a little study, and pointing to an old tea-tray standing on the table, containing a few watch-glasses, test-papers, a small balance and a blow-pipe, said, "There is all the laboratory I have!" Stothard learned the art of combining colors by closely studying butterflies' wings; he would often say that no one knew what he owed to these tiny insects. A burnt stick and a barn-door served Wilkie in lieu of pencil and cauvas. Bewick first practiced drawing on the cottage walls of his native village, which he covered with his sketches in chalk; and Benjamin West made his first brushes out of the cat's tail.

Fergusou had laid himself down in the field at night in a blanket, and made a map of the heavenly bodies by means of a thread with small beads on it, stretched between his eyes and the stars. Franklin first robbed the thunder-cloud of its lightning by means of a kite made with two cross sticks and a silk handkerchief. Watt made his first model of the condensing steam engine out of an old anatomist's syringe, used to inject the arteries previous to dissection. Gifford worked his first problem in mathematics, when a cobbler's apprentice, upon small scraps of leather, which he beat smooth for the purpose; while Rittenhanse, the astronomer, first calculated eclipses on his plow-handle.

Mining and Scientific Press Patent Agency.

SAN FRANCISCO.

Information About Obtaining Patents.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just mentioned, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analagous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of governments that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have excess to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: Dewey & Co., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be prescribed to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the stage of the application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo; new designs for articles, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every caveat.....	10
On every application for a patent.....	15
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for re-issue.....	30
On every additional patent granted on a reissue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunc tion from the Court, to an arrest of or prohibition to the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor such legal proceedings in behalf of our clients as may be necessary. Our charges will be moderate, and proportionate to the labor involved.

Appeals.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the U. S. Court, of the District of Columbia. These appeals are heard by any of the Judges before whom the applicant elects to bring the case. No Jury. All the papers, models, etc., are sent by the Commissioner to the Judge, who then reviews the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty-five dollars. The Judge appoints a day of hearing. The applicant can appear in person or by counsel to state his case and file a written argument. Five days are allowed the opponent to put in an answer, and a similar period to the appellant for a closing reply.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

It is Impossible for editors to know all the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions or machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:
Saturday Morning, Jan. 21, 1865.

THE LA CANDELARIA MINING CO.

We have several times made allusions, more or less at length, to the La Candelaria mine, which is located in Durango, Mexico, and which constituted one of the five rich mines from which the famous Zambrano derived his immense riches, who, it is known from authentic records, paid to the king of Spain the enormous amount of $11,000,000 in twenty-four years—the same being only one-fifth of the proceeds of his mines!

The history of this mine would occupy a volume, and the amount of treasure which has been taken from it is enormous, and yet it has never been worked except by the rude process employed by the Mexicans. It is considered to be the leading mine, or the Comstock of the San Dimas District, where now some sixty valuable mines are known to exist. This celebrated mine, after a varied history has at length fallen into the hands of a California company, which was incorporated in the 11th of July, 1863. This company took possesion of the mine in September 1863. Since which time active operations have been going on to re-open the mines which had become completely dilapidated by being allowed to stand idle for some thirty-five years. This work is still in progress, and being carried on with every prospect of the most abundant success. The officers of this company are Richard Cheeney, Pres't.; Mark Brummagin, Treas.; Geo. A. Hill, Secretary and Joseph G. Rice, Superintendent. The Trustees are Richard Cheeney, E. H. Winchester, Mark Brummagin, Calvin Brown and A. E. Fraser.

A New Quartz Crusher.—The Amador *Ledger* mentions a machine for crushing quartz, just invented and in operation at Jackson. The editor of the *Ledger* says it is the very thing needed by our miners. It is simple in construction and in operation, and its cost so trifling, that it comes within the means of almost everybody. It crushes five tons of quartz in twenty-four hours, and three horse-power is sufficient to run it. The machine can be put up, in perfect running order, by two men in one day. He thinks there are hundreds of quartz veins in Amador county that would pay handsomely with some such mill as the one above mentioned, where all the labor was performed by the owners of the claim.

We will thank the editor of the *Ledger*, or "any other man," for a particular description of this mill.

Hand Mill.—Mr. Hanscom has just sent one of his hand machines, weighing but 175 pounds, and yet capable of crushing about 500 pounds per day, to a mine in Montgomery district, Esmeralda. The parties were in such a hurry for it that they ordered it to be put through as "fast freight."

A turtle weighing 900 pounds, was recently taken on the Maryland coast.

PETROLEUM—HOW AND WHERE TO FIND IT.

The exact source of petroleum is a matter yet quite uncertain—whether it has been distilled from bituminous coal, leaving anthracite as its residuum; or whether it has resulted directly from bituminous fermentation of marine or other plants; or whether it be of animal origin, as some assert, it matters little in an economic point of view. Whether it be a resultant of the decomposition of coal or fish, vegetable or animal matter, makes but little difference to the modern seeker after its deep and hidden recesses. Science has been invoked, and under its teachings many writers have been busy giving us rules for seeking and collecting the coveted oil, while labor and capital have likewise been equally busy in showing, by actual explorations, that science is, to all appearances, partly right and partly wrong in its inferences.

The business of searching for oil has not yet been reduced to so much of a science, as to be implicitly depended upon in petroleum investigations; indeed one could hardly expect such a result to be attained in the short experience of only five or six years. Still, much valuable information has been obtained by geological examinations, and by a careful comparison of the results of working in different localities. It is our object at this time to collect and throw together, for the benefit of our readers, whatever observations have been placed upon record, in other localities, which may possibly assist the California explorer after this new source of material wealth.

The existence of what may now be termed oil "indications" have been known in California for many years; and soon after the astonishing results of the petroleum developments in Pennsylvania began to be noised through this State, more careful explorations and examinations were made, and in several instances active steps were taken for a thorough development of the surface indications. The first matter sought to be ascertained, and very properly so, was to determine whether the crude oils found here were identical or nearly so, with those found in Pennsylvania. The results of these examinations have been all that could be desired.

Facts have gradually accumulated of a character to prove, quite conclusively, that California is as much favored in this particular, as the most fortunate of the Eastern States. Actual explorations have established the fact that petroleum and bitumen exist throughout the entire extent of our coast range of mountains, from Humboldt county in the north to San Diego in the south. It exudes through the soil in numerous localities, on both sides of this mountain range, and the opinion is now quite universal that science, experience and labor must soon develop at least scores of localities that will equal, if not excel, the most famous wells of Pennsylvania. Already we are told, on undoubted authority, that one auger at least, has pierced the overlying strata and struck an extensive reservoir of oil below, from which an uninterrupted stream of oil flows to the surface. This locality is at Buena Vista, in Tulare county, about 200 miles south of this city. The process of boring is now in progress, or soon will be, in quite a number of other and diverse localities, and we may reasonably look for further and important developments in this direction at an early day. What is now wanted by Californians is the experience gained by similar operations elsewhere; and this we are gradually acquiring.

Those who have had much experience in sinking oil wells, especially in Pennsylvania, will tell you that there are there three strata of sandstone rocks, in which the oil is there found. The first of these strata is usually found at a depth of fifty or sixty feet from the surface. The oil from this deposit is called "surface oil." The deposit consists chiefly of salt water and gas—a comparatively small quantity of oil is found, and the supply is generally exhausted after a very short time. On passing through this strata a larger deposit, containing more oil, and that of a better quality, is generally found. We are not aware that any bore has been put through this second strata in the Virginia wells, but in Pennsylvania, the borers are now not satisfied until they reach the third strata, which is found at a variable depth of from 500 to 1000 feet from the surface. Here is what appears to be the chief basin or reservoir, and here are found the vast deposits of oil, from which, during the past year, Pennsylvania has drawn more wealth, than the entire Pacific Coast has realized, during the same time, from all its justly celebrated mines of gold, silver and copper.

It will be well for California explorers to take especial notice of an important fact in this connection. Owing to the ignorance, among the early oil seekers in Pennsylvania, of the existence of the three separate strata of sandstone, and the fact that each strata held, locked up in its sectional embrace, reservoirs of oil of varied extent and value. Many of the early pioneers were led to abandon their works in disgust, after reaching the first strata and finding nothing but a trickling stream of oil, in a large flow of water which was oftentimes forced to the surface at the expense of much labor and cost. Shrewder managers succeeded these first faint-hearted operators, who penetrated to this third strata and reaped for their enterprise, some of them at least, colossal fortunes at once. Californians will appreciate the propriety of following their claim down to the "bed rock," never despairing until they have reached it; and pitching in again, at a new locality, if they should chance to get down on a barren spot.

In some localities the oil is found in the upper strata of a variety of limestone, which is largely composed of fragments of corals and sea shells. The cavities of these corals and shells are in some cases said to be filled with liquid bitumen, which at times distils from the rock where it is fractured. The oil is doubtless present by percolation from above.

From the fact of petroleum being thus found in connection with the limestone, some have inferred that the limestone itself furnishes the material out of which the oil is manufactured by nature. A writer in the Pittsburg (Pennsylvania) *Chronicle*, adops this idea, and describes the process as follows:—

Petroleum is known to be a hydro-carbon, composed of two gases. One of them—hydrogen—is a constituent of water, and, of course, is as inexhaustible as the ocean. The other is a constituent of all vegetable forms, and in many of our rocks. One hundred pounds of limestone, when burned, will weigh but sixty pounds. The part driven off by burning is carbonic acid. Underlying the "oil rock" is a stratum of limestone, of unknown thickness, but known to be upwards of one thousand feet in depth. The water falling on the surface and percolating through the porous sandstone that underlies the oil rock, becomes charged with salt, potash, saltpetre, and other chemical ingredients, and finally reaches the limestone rock and decomposes it—the carbon in the rock and the hydrogen of the water uniting to form oil; while the oxygen is set free to ascend to the atmosphere, or unite with minerals and form oxyds.

Mr. Cherry, who was recently employed by the Point Arenas Oil Company to visit and report upon the condition and prospects of that claim, seems to have adopted the same idea. The fallacy of this theory is clearly shown by a correspondent of the *Call* of Sunday last, in the following paragraph:—

No one denies that limestone contains carbonic acid, but there is no condition present that should liberate the same from the lime, nor still less that it should be changed into carbon. To decompose the carbonate of lime would require the action of great heat or acids. To change the carbonic acid into carbon, it wants the action of a very powerful deoxydizing substance, as, for instance, potassium, phosphorus, etc. The same is the case with the water. To produce hydrogen from it, it would require a galvanic battery, or the action of zinc and dilute sulphuric acid, or some other equally powerful chemical operation. None of these conditions can be supposed to be present, therefore there is not the least reason why limestone should produce carbon, nor the water hydrogen. But supposing this to be the case, I cannot see why carbon and hydrogen should produce petroleum. We might just as well say sugar consists of carbon and water. Let us mix charcoal and water, and there is sugar.

The shareholders of the Point Arenas Company, however, need have no fears of a failure to find oil in their proposed enterprise at boring, in consequence of the fallacy of the theory of its formation, suggested by the expert. So much of his report as is confined to the geological occurrence of the strata where they expect to obtain oil, is certainly most favorable to success. Limestone, we believe, is never found as an oil containing or producing medium. It often forms an underlying stratum on which the oil rests, the oil sometimes entering it to some depth, probably by percolation, as in the case of the carniferous limestone of south western Pennsylvania, already noticed. The only favorable character which attaches to limestone, in connection with oil, is the fact that it affords so impervious a bedding for its deposit, and not unfrequently extensive pockets for reservoirs of the oleaginous fluid which has percolated through the overlying strata of sandstones and shales.

Oil workers and speculators are sometimes deceived by mistaking a simple limestone *pocket* for a living spring of oil, having its head in an oil producing stratum. An instance of this kind recently occured at the Enniskillen oil region in Canada, where a party bought what appeared to be a valuable claim for $30,000, having a well already yielding about forty barrels per day. A second well was afterwards sunk, which, at a depth of 400 feet flowed so freely that the proprietors were enabled to sell out for $400,000. Three weeks afterwards both wells ceased flowing, and on driving the auger a little deeper, they found they were in limestone, and had merely exhausted a "pocket." The wells were worthless, as no one there has any confidence in finding oil by penetrating limestone.

One wealthy company, who own a valuable well at Enniskillen, has resolved, however to test the truth of this theory and have been boring into limestone for some months, near Hamilton, Canada West. At last accounts they had penetrated some 500 feet without a trace of oil. They will never find it in that well.

In our next we shall endeavor to give some valuable "hints to prospectors" who are in search of oil.

Echo District.—The new mill over the ridge is in operation. A considerable amount of ore has been put through, and Geo. W. Holt, Superintendent, was over this week, for chemicals for amalgamating. His crusher is not a battery, as in common use; the ore is reduced to pulp by a new machine, invented by Hanscom. Mr. Holt says it works charmingly—reducing ore at a rate equal to a five stamp battery, and being smaller, reduces the cost of a mill and the expense for freight.—*Humboldt Register*.

The mill above refered to consists of one of Hanscom's Crushers, weighing about 900 pounds, costing $200 in this city, and two of Hinkle's amalgamators, weighing 1900 pounds each, and costing about $300. Hanscom's Crusher is too well known to the readers of the Press to require any description here. The practical working of the machine, as above detailed, must be highly satisfactory both to the patentee and the proprietors of the mill above referred to. This machine receives the rock from the platform, reduced to about the same size as required for stamps. The Hinkle Crusher consists of a horizontal cylinder, with an axle passing horizontally through it, and protected by stuffing boxes. The grinding is effected by shoes attached to the axle by extension arms, and which are forced against the inner circumference by centrifugal action. Two of these machines are employed to grind and amalgamate the five tons of rock reduced by one of Hanscom's 900 ℔ crushers. This is all the machinery of the mill save the motive power, which is a steam engine. Only about four horse-power is required to drive the machinery. We have thus a quartz mill, reducing five tons of ore, by crushing and pan process, weighing, aside from its motive power, only 4,700 lbs., and costing in this city but $800.

The Contra Costa coal mines can supply one hundred and twenty thousand tons annually. This coal is now used by all the steamers plying in California waters.

CALIFORNIA MADE LOCOMOTIVES.

A new feature in our home manufactures is about to be inaugurated. Donahue, Booth & Co., proprietors of the Union Foundry, in this city, have contracted to build two first-class locomotives for the San Francisco and San Jose Railroad Company. They are to weigh twenty-eight tons apiece, and will have sixteen inch cylinders, with twenty-four inch stroke and five feet driving wheels. They will be first-class locomotives in every respect, in style and finish, and will be capable of hauling from thirty-five to forty freight cars on an ordinary road. Everything will be manufactured in this city, except the tires and flues, which will be sent across the Isthmus from the East. One of the engines will be finished on the first day of June, and the other on the first of July next. These will be the first regular locomotives made on the Pacific coast. They will be built under the direction of Mr. R. B. Bishop, master mechanic of the San Francisco and San Jose Railroad. We understand that Messrs. Donahue, Booth & Co. are making extensive preparations for this kind of work. We have here a new and profitable feature added to the manufacturing enterprise of San Francisco. The rapid construction of railroads in this State will soon create a great demand for locomotives, and we trust this initiatory attempt to furnish them from our own shops will demonstrate the fact that San Francisco mechanics can turn out as perfect work in this line as can the mechanics of any other city or place in the Union.

We understand that the San Francisco and San Jose Railroad Company have now in store in this city all the tools and machinery requisite for establishing a first class machine shop. This machinery will soon be set up, so as to enable the Company to manufacture their own cars and do all their own repairing. The Company has now a temporary shop at the Mission, where they have constructed the wood work of some ten passenger cars and all the freight cars, the iron work being brought from the East. When their new shop is up they will be able to furnish their own iron as well as wood work.

THE GENESEE VALLEY COPPER SMELTING WORKS.

Messrs. Bolinger, Blood & Co., who have a valuable copper mine in Genesee Valley, Plumas county, have recently constructed an extensive furnace for smeltiug copper ores, in the immediate vicinity of their mine. The furnace has been built at an expense of $30,000, under the immediate direction of Mr. J. C. Chapman, also one of the proprietors of the mine and an experienced copper smelter. It has been constructed on the principle of running copper direct from the ore, without the use of any flux other than the slag and metal from previous meltings and a judicious mixing of different ores, although, it is claimed that after once getting to work, any quantity of ore can be worked alone.

The furnace was started up, recently, for the first time, as an experiment, and charged with seven hundred and fifty pounds of ore, ranging from eight to thirteen per cent., with an average of eleven per cent. The blast was kept on three hours and fifteen minutes, when it was found that the dampness had raised in the hearth, causing the metal to adhere to it, raising the heat above the fire-proof lining, and melting the upper lining, which was of common brick, and the blast was shut off. The result was forty pounds of metal, a sample of which may be seen at this office. The experiment was perfectly satisfactory to the proprietors. The coal used was made from pine wood, which, it was found, made a blaze so much higher than oak, that the proprietors have found it necessary to build the stack higher.

The necessary repairs to the furnace having been made, the fires were again started, a few days afterwards, and in three hours after the blast was put on, the furnace was tapped and a pig of copper run, weighing fifteen pounds, and shortly after the front lining (which was of common brick) again melted down. It is now the intention to line the furnaces with a species of asbestos rock, of which there is a quantity near there, and it will probably be two or three weeks before we shall again hear from them.

The proprietors feel quite sanguine that enough has been done to prove the practicability of reducing our copper ores at home.

The process employed, we believe, is somewhat novel, but in what particulars we are not informed. If it succeeds and works can be put up at the small outlay demonstrated in the present instance, it will work an entire revolution in copper mining, and we may look to that as one of the chief sources of future wealth to California. Hitherto about all of our copper ore has gone to Swansea for smelting, and the cost of carriage by land and sea has been enormous. We shall await further developments in regard to this new process with great interest.

A correspondent has furnished us the following description of the works:

They are situated at Genesee Valley, about five miles from Taylorville, and consist of a furnace house, coal house, blacksmith shop and boarding house. The furnace house is built for four furnaces, of which two are up; those are blast furnaces, built something after the French plan, as described by Piggot in his work on copper. The blast is driven by two double-acting piston bellows, four feet in diameter, the whole being driven by an overshot water wheel of about twenty-five horse power. The works do great credit to the company, as well as the designers and builder, Mr. N. Platt. It was not the intention of the Company, when they commenced the works, to be ready for full operations before next spring, but to get ready, and prove the practicability of smelting the different ores at a profit, and find and test some fire-proof material for lining the furnaces, and be prepared for full operations when spring opens. They have proven that the ores can be smelted readily and at a profit, and now all that remains to be done is to test some fire-proof material and then our copper mines will enter upon a career of permanent prosperity.

EASTERN FINANCES.

Our latest mail advices from the East are to the 23d ult. The gold market had been materially affected by favorable army news from Sherman and Thomas, but speculators for a rise, succeeded in sustaining it until the capture of Savannah was announced when it quickly fell from about 230 to 210. Subsequently, under the President's call for more men, gold rallied a little and closed at the above date at about 222.

The Stock Market at New York had been dull and railway and miscellaneous were much lower. Government securities, however, had undergone decided improvement and a considerable rise took place in the gold bearing portion of the debt, owing partly, to the supposition that Secretary Fessenden would soon withdraw all loans from the market except the currency seven-thirties. Subscriptions to the ten-forties (six P cent. bonds, interest payable in gold) had been very brisk and $5,000,000 were taken at New York alone, in two days. Some $110 000.000 of the $200,000,000 authorized by Congress had already been subscribed for and it was believed that no further subscriptions would be received. It seems to be the intention of the government to stop the further issues of gold-interest bonds. Mr. Fessenden, in his circular issued the 11th of December, remarks, that "desiring to avoid any further issue of bonds, the interest of which is payable in coin, or any further increase of paper circulation, I ask your special attention to the seven and three-tenths notes now offered to the public." He also reproaches the National Banks for their want of patriotism in not pushing this currency loan, and says that in extending to National Banks authority to obtain subscriptions and the offer of liberal commissions for services performed it was expected, that especially connected as they are with the government, and profiting by that connection, they would have been stimulated to such exertions as would insure success. Before resorting to other agencies, the Secretary therefore, appeals again to the National Banks, in the hope that they will undertake this most necessary work with a spirit and energy which will demonstrate that the reorganized fiscal agents of the government may at all times be relied on for adequate exertions to procure the means necessary to its daily wants.

[Written for the Mining and Scientific Press.]

Stockton Correspondence.

Stockton, Jan. 14, 1865.

Eds. Press:—I have been three days in Stockton, and have been observing with a careful eye everything which I have thought of interest to the readers of the Press. I shall begin with that most common of all topics

THE WEATHER.

It has been cool and foggy in the morning with occasional frosts, and clear and fine in the afternoon, for the last ten days, but now it begins to look like rain again, and we have no idea of what is coming next. The mud, however, has not dried sufficiently to allow teams to pass into the country with loads, and though we occasionally see one ploughing through the streets. it is generally next to impossible to tell what has been the original color of the horses, as they are usually enveloped in a uniform coating of mud, while each wheel carries adobe clay enough to be a load by itself for a common team.

BUSINESS,

In consequence of the impossibility of communication with the interior, it is very dull, yet all hope for better times, as the abundant rains give prospect of bountiful crops at the coming harvest. No stores have closed, and though there is little money in the hands of business men, yet they are all confident that they will be able to come out all right after harvest. But, while business is dull, the people are turning their attention, somewhat, to

INVENTIONS.

Among these is a new, double-acting force pump, invented by Mr. Wm. D. Hooker, of the Globe Foundry, which is attracting much attention. The principal feature of this pump is the chamber into which the water rises, and which contains all the valves. This chamber is cast separate, and fastened to the pump-barrel by bolts passing through flanges on the sides of the barrel, and ears attached to the side of the chamber. The chamber is divided by a partition extending diagonally nearly from one end to the other, into two compartments; one, that from which the water rushes into the vacuum formed in the barrel of the pump, by the raising and lowering of the plunger, being wider at the lower than at the upper end, and the other, that from which the water rises into the air chamber to be discharged, in the reverse proportion. Each end of this oblique partition is connected with the farther side of the chamber by two short horizontal partitions, one above the other, leaving space between them for the opening through which the water passes into and out of the barrel of the pump. giving the whole partition the appearance of the letter Z with the upper and lower horizontal lines double. The spaces between these short partitions communicate with the receiving compartment of the chamber, by circular openings in the lower partition of each pair. and with the discharging compartment by similar openings in the upper ones. These openings are guarded by valves, which are opened by the action of the water and closed by their own weight, and constitute all the valves in the pump. These valves are not hinged, like those in the Douglas and Hansbrow pumps, but are kept in position as they rise and fall by iron stops or guides, the whole valve rising and falling like the ball-valves in the stomach-pump.

The advantages claimed for this pump are: First. Its simplicity, there being no hinge-valves and no valves in any way connected with the barrel of the pump. Second. The ease with which any defect in, or damage to the valves, may be repaired, as they are all contained in a chamber which can be readily taken from the pump, and in which they lie perfectly loose, and can be taken out and replaced at pleasure, without interfering with the barrel of the pump, or the pipe. Third. It possesses an advantage over some pumps in being a vertical pump, and consequently requiring less room and being more easily worked, and less liable to get out of order. Fourth. It is much cheaper than any other pump that will perform the same work.

I was present at a trial of this pump, at the Globe Foundry, yesterday, when with one with a two-inch barrel, operated with one hand, a stream was thrown, from a quarter-inch nozzle, over the smoke-pipe of the foundry, a hight of sixty feet, and a steady stream was kept flowing by giving the plunger a motion of less than one-eighth of an inch, showing that the valves work perfectly, and yield readily to the pressure of the water.

Mr. Hooker has filed his caveat, and applied for a patent. As soon as his papers are received the pump will be fully illustrated and advertised in the columns of the Press.

COMMUNICATION

With San Francisco is kept up by means of the California Steam Navigation Company's boats, and is reliable; but woe! unto the luckless wight who wishes to move himself or his freight in any other direction. As a sample, freight for Woodbridge, ten miles distant, overland, is shipped by the steamer Pert, *via* the forks of the Mokelumne. a distance of over one hundred miles, this being the best practicable route. Stages run from here to Copperopolis, and also to Knight's Ferry, making an average speed of three miles an hour, which is the best time that is made on any line now.

PUBLIC INSTITUTIONS.

In spite of all these disadvantages, the people of Stockton, have enterprise sufficient to support two daily newspapers, the *Independent* and the *Record*, both of which have a liberal circulation, and of which they are every-way worthy. I have received from the editors of these papers every courtesy and kindness which I could expect from tried personal friends.

The principal hotel is the Weber House, a well-kept and pleasant house, where the traveling public can obtain all creature comforts, including first-rate dinners, dispensed by Mr. Kelly, who is a model landlord. and his polite and accommodating clerk, Mr Baxter, assisted by a corps of quiet and attentive servants.

The people of Stockton have nearly all been deeply interested in copper mining, and since the fall of copper stock a large number of them seem to think mining all a humbug, yet those who are interested in the principal claims are now reaping the reward of their perseverance and industry.

At the office of Meader & Co. I was shown some fine specimens of pure copper, which had been smelted from the poorest ores of the Union mine, those which were thought to be too poor for shipment, but which produce a splendid specimen of metal when subjected to the smelting process.

There are many other matters worthy of notice, but I have already transcended the intended bounds of this letter, so I will subscribe myself,

Yours, faithfully, D.

Calaveras Silver Ore.—We understand that a ton of silver ore from the Eclipse claim, Salt Spring Valley, Calaveras County, has arrived in this city, the past week for the purpose of being tested. It is stated that the ore looks well, and is said to have repeatedly assayed from $300 to $700 per ton. If the present lot is a fair average of its yield, it bids fair to become a very valuable claim.

Information about Copper Smelting.—A gentleman, thoroughly and practically acquainted with the business of copper smelting, is now engaged in the preparation of a series of articles on that subject, in which he will endeavor to convey the fullest information at present attainable, and such as will be of the most practical value to copper miners in California. The first of the series will appear next week.

The Mining and Scientific Press.—This invaluable journal, the only one devoted to the mining and mechanical interests of the Pacific Coast, has commenced its tenth volume. Under the able management of its present experienced and enterprising proprietors, the Mining Press is an honor to the State. In its columns may be found an immense amount of valuable information on subjects connected with mines and their products, machinery and its uses. As this useful paper is published at the remarkably low price of $5 per annum, no person connected with mines or machinery, or who expects to be, should be without it.—*Grass Valley Union.*

State Agricultural Society.—The annual meeting of the State Agricultural Society, for the election of officers for the ensuing year and the transaction of such other business as may be presented, will be held at Agricultural Hall, in Sacramento, on Thursday next at two o'clock P. M. Notwithstanding the unfavorableness of the season, over eight thousand dollars of the indebtedness of the Society has been cancelled during the past year.

The greatest civil war that England has ever had was that contest which is known as the war of the Roses, or the war of York and Lancaster. It occurred in the fifteenth century, and lasted. through with considerable periods of peace, for some thirty years.

Railroad Collision.—A collision occurred on the Pacific Railroad, near Dry Creek, on Monday, by which several cars were knocked off the track, but no person injured.

There are 5,000,000 native Germans in the United States, and this year's emigration will add 70,000 to that number, says an exchange from the Atlantic coast.

Now in Its Tenth Volume!

— THE —

Mining and Scientific Press,

— THE MOST —

Profitable Newspaper

— FOR THE —

Readers of the Pacific Coast.

Issued Every Saturday Morning.

DEWEY & CO., Publishers.

Our Journal enters its TENTH VOLUME with marked prosperity and improved facilities and resources for furnishing a handsome, valuable and well filled sheet.

We believe that the PRESS furnishes more information of ready application and intrinsic value to its readers than any other journal on this side of the Continent. Its circulation has doubled during the past year, and, for the economy and interests of the industrial classes of this and neighboring States, its subscription list should be more than trebled for the ensuing twelve months.

We shall continue to make the MINING AND SCIENTIFIC PRESS substantially

An Instructor to Prospectors,
An Economist to Millmen,
An Assistant to Active Miners,
An Economizer for Mining Advertisers,
A Reliable Reporter for Shareholders,
A Faithful Monitor for Stockdealers,
An Intelligencer for Mechanics,
An Incentive to Inventors,
A Reflector for Patentees,

And a Helpmeet to all Industrial Classes Upon the Pacific Coast. We shall give accurate and frequent

THE SHAREHOLDERS' DIRECTORY

Will comprise a record of all Notices of Meetings of Mining Companies, Notices of Assessments, amounts levied, date of advertising sales, and day of sales, announced in all advertisements appearing in the San Francisco papers during the period of the Volume.

FOR SENDING ABROAD.

As a paper for mailing regularly to your friends in the East or to correspondents elsewhere, none can be selected more appropriate, or better calculated to dispense reliable information with regard to transpiring events on this coast and the progress of California.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

SUBSCRIPTION IN ADVANCE.

Pacific Mail Steamship Company.

The following Steamships will be dispatched in the month of January, 1865:

GOLDEN CITY - - - - Capt. Lapidge,

FROM FOLSOM STREET WHARF,

At 10 o'clock A. M., punctually, Monday, January 23d,

For Panama.

Passengers will be conveyed from Panama to Aspinwall by the Panama Railroad Company, and from Aspinwall to New York by the Atlantic and Pacific Steamship Company.

OLIVER ELDRIDGE, Agent.

Corner Sacramento and Leidesdorff sts.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

[ADVERTISEMENT.]

To the Public, and to Millmen in Particular.

As Thomas Varney has not, up to this date, withdrawn his notice in the "Mining and Scientific Press," in which appears the following language:—

"All persons are warned against purchasing machines made at the Miners' Foundry, called 'Wheeler's Amalgamators,' as they are an infringement on my patent, and a suit is now pending in the United States Circuit Court, against the parties infringing;"

In justice to myself I am compelled to give to the public a statement of the facts in the case, and show the position which Mr. Varney and myself occupy as Patentees. He commenced suit against me, and the Miners' Foundry, for $90 000, about the 1st of March 1863, and threatened suit against any and all persons who should buy my amalgamators, thus greatly damaging my business. To show the injustice of his suit against a "poor hard working mechanic," I will quote from the opinion of Judge Hoffman, as rendered in the case last November. He says:

This is an action for the infringement of a patent issued to the plaintiff on the 10th of December, 1861, for an "Improvement in Amalgamators for gold and silver." The mach ne alleged to be an infringement has also been patented—the patent being dated December 8th, 1863. The defendants deny the alleged infringements, and the novelty and originality of the plaintiff's invention. They have also given notice, under the statute, of various other defenses, hereafter to be noticed.

Models of the two machines were exhibited in Court, and a large number of witnesses called to explain their construction and mode of operation. It is apparent that the patented machine of the defendant closely resembles, if it be not substantially identical with, the improved and modified machine now manufactured by the plaintiff. But the inquiry is not whether Wheeler's machine resembles that lately used by Varney, but whether the former is substantially the same as the machine described in Varney's patent. That Varney has, in many important particulars, modified the machine as described in his patent, is obvious. Indeed, his late machines resemble much more nearly in external appearance, and in their mode of operation, the Wheeler patented machine than they do a machine constructed according to the drawings and specifications of his patent.

After describing Mr. Varney's pan and its operation, the Judge says:

It appears, however, that the idea of working ores in a batch, by causing them to pass repeatedly between mullers, the upper one of which is provided with openings at the center, is by no means novel.

J. E. Clayton testifies that, so long ago as 1845, he arranged a machine in Tallahoosa, Alabama, for the reduction of gold ores, which embodied substantially the same principle.

* * * * * * *

In Overman's Metallurgy, p 267, a similar arrangement is described. * * * It is evident that the author is here describing an existing and well known machine, the usefulness of which has already been ascertained.

It is also apparent that the result aimed at is the same in this machine as in that of the plaintiff, and that the means adopted to accomplish it are substantially similar. In both machines the pulverization of the ore is effected by means of a bed plate upon which a muller rotates, with central openings to permit the pulp to pass continuously and repeatedly between the grinding surfaces until the operation is completed.

Amongst other things the Judge quotes the following from Judge Story:

But in all cases where the patentee claims anything as his own invention in his specification, Courts of law cannot reject the claim, and if included in the patent and found not to be new, the patent is void, however small and unimportant such asserted invention may be.

* * * * * *

Here the plaintiff claims a particular position of machinery as his invention, and it clearly appears in evidence that the position is not new. It has existed before—not in machines exactly like the present, but in machines applied to analogous purposes, viz: in machines applied for the same purpose as the plaintiff applies them. The objection therefore, is fatal.

In the defendant's machine, the pan in two parts, provided with flanges, packing, &c., to which the plaintiff in his patent attaches so much importance, is not used, but a deep pan is substituted with a wooden cover.

The arrangement of the slots or shoes on the muller is different. The upper muller is provided with spiral ridges arranged to operate with similar ridges reversely inclined on the inner surface of the pan, to raise the pulp and promote the circulation. The upper muller is attached to the shaft by an universal joint, and by a mechanism quite dissimilar to that described by the plaintiff. And for the scrapers are substituted broad guide plates extending and secured to the edge of the pan, and capable of being elevated or depressed by means of a mechanism not found in the plaintiff's machines.

Assuming then—as in the point of view in which we are considering it we must—that each of the several parts of the plaintiff's machine is old, and not separately patentable, it seems clear to me that if the patent for the machine can be sustained, as for a new combination; which I think doubtful, the combination of the defendant is at least as novel as that of the plaintiff.

We have already seen that the muller rotating upon a bed plate, with central openings, and arranged in a pan so as to create a circulation of the pulp, is not a new invention. The tub, composed of two parts, with flanges, packing, &c., is not claimed to have been used by the defendant. In fact it is now discarded by the plaintiff, and a deep pan, with muller attached by an universal joint, has been adopted by him in his later machines. The infringement, if any, must consist in the use by the defendant of the scrapers described in the plaintiff's patent.

The inquiry thus arises—are the curved plates described in Wheeler's patent, substantially the same in their structure and operation as the scrapers of the Varney patent, and if so, do the latter constitute a "material and substantial part of the things patented by Varney, definably distinguishable from the other part." To determine this question, a brief description of Wheeler's machine is necessary.

The Judge then describes the Wheeler pan and the Varney pan and scrapers, and says:

In the Wheeler pan four plates are used while Varney employs only two scrapers. The form or curve given to these plates in both machines is similar, though not identical; but in their structure, arrangement, and the use for which they are intended, there is an essential difference. The scrapers of Varney are represented as of inconsiderable width, and extending from a ring at the center to the periphery of the muller—they rest apparently upon the surface of the muller, and no means of elevating or depressing them are mentioned in the specifications or exhibited in the drawings.

The plates of Wheeler are of considerable width, and attached to a frame suspended from the top of the shaft, resting upon a vertical screw, by means of which the frame and plates attached to it may be elevated or depressed. The plates extend to the inner surface of the pan, where they are secured by slides. The office of these plates, as described in Wheeler's patent, has already been mentioned. It appears to me that the scrapers of Varney neither serve, nor were intended to serve, any such purpose. [Here the Judge gives his reasons for the above opinion.]

For these reasons I am of opinion that the curved plates of Wheeler differ from the scrapers of Varney in their form and arrangement, their object and effect, and that therefore their use is not an infringement of Varney's patent.

Much testimony was taken to show that in fact Wheeler's invention was prior to that of Varney's and that the latter derived his ideas from the former

It is claimed by Varney that his invention was, in its essential features, matured and perfected in August, 1861. But this statement seems hardly consistent with his declarations or his conduct.

Varney's application for his first patent was not made until the end of October, 1861. That machine has since been discarded as useless.

If then, at the time of this application, he had already matured and perfected the invention of another and far better machine, he committed a practical fraud upon the public in withholding from them the benefit of his skill and ingenuity. It is certainly strange that he should have gone to the trouble and expense of procuring a patent for his first machine, and delayed, for nearly a year, his application for a patent for the improved machine which he had, as he says, already invented.

It may well be doubted whether, if it be true as Varney states, that at the time of his application for his first patent he had already completed and perfected his improved machine, the suppression would not be fatal to both. It appears in evidence that, so early as December, 1861, Wheeler had conceived and communicated to Stewart & Kirkpatrick at Washoe, the idea of his machine. He explained to them the mode in which the circulation, or over and under current was to be produced, and the guide boards by which it was to be assisted.

In January, 1862, drawings of this machine were received at the Miner's foundry, and Stewart, the partner of Churchill, was desirous of having his pans constructed on that plan. The theory and construction of the proposed pan were fully explained to Varney, who succeeded, however, by affecting to consider Wheeler's pan a "humbug," in dissuading the parties from adopting it, and in inducing them to order pans made on the model of his own patent. These were subsequently discarded as useless. We are driven to adopt one of two suppositions: either that Varney wilfully deceived Stewart in inducing him to order an inferior pan, or else that he had not at that time discovered the mode of producing the over and under current, recognized his utility and invented a machine to effect it.

Wheeler commenced manufacturing his machines in January, 1862. He commenced using them in June of the same year. They were constructed at the Miners' Foundry by the defendants to this cause, under the immediate observation of Varney. But in his conversation with Scott, in July, 1862, and in his communications with the defendants, he does not appear to have intimated that he was the first inventor of the Wheeler machine, and that in constructing the latter they were violating his rights. Up to the end of 1862, he continued to have his own pans built at the same foundry; and if he really considered the construction of Wheeler's pans to be an infringement of his own invention, his silence is inexplicable. His delay in applying for his second patent is equally unaccountable. In August, 1861, he had, as he says, completed and perfected his invention of his improved machine, and yet in October of that year he applies for a patent for his first and imperfect invention, and delays his application for a patent for his improved and perfected machine until the end of June, 1862—more than a month after Wheeler had taken the preliminary steps to obtain his patent.

It is unnecessary, however, to pursue this inquiry further, for in the view I have taken of the case the question of priority of invention is immaterial.

The Judge then notices the other grounds of defence, and says:

If this view of the effect of that statute be correct, it affords a defence to Wheeler as well as the other defendants. It is not pretended that he has used any machines not manufactured by them, or that he has infringed the plaintiff's rights, otherwise than by receiving from the other defendants the sum agreed to be paid by them on the sale of his machines.

I find, therefore, for the defendants.

[In this candid statement to the public, I should have preferred to have given the decision of the Judge and the findings of the Court in full, but for the great length of space they would occupy; and I will state that the same can be found in the "Mining and Scientific Press," of December 10th and 31st, 1864, and invite their thorough perusal.]

It will be seen by the above statements that Mr. Varney is infringing on my patent right by the use of wide guide plates in his pans, instead of my infringing on his patent. The truth is, he never used any but narrow scrapers in his pans until after I had put my pans in operation, and they had proved a success. None of his pans made prior to the year 1863 ever run six weeks without being condemned and thrown aside. This may account for the fact that he afterwards altered his patterns and made them like mine, with an open, deep pan, and wide guide plat s instead of scrapers, and put a wooden cover on the pans.

Having established my right in my patent Amalgamator, it is now my turn to protect myself against the infringement of "Mr. Varney, or any other man," and I intend to do it; and all persons are hereby warned not to purchase or use machines called "Varney's Amalgamators," as made at the Union Foundry, Pacific Foundry, or any other place, as they will make themselves liable for an infringement on my patent right.

Having made some important improvements in my Amalgamators, the public are invited to call and examine them at the Miners' Foundry, San Francisco, or at Prescott & Schiedel's Foundry, Marysville, where they are manufactured. ZENAS WHEELER.

San Francisco, Dec. 27th, 1864.

How to make your Remittances.—In most of the mining towns, bankers will furnish checks on San Francisco at par, (or at a very slight advance) to those who wish to pay us for subscriptions, advertising, mining blanks, etc. When it is more convenient, money may be remitted by mail at our risk if the parties sending will register their letters. Money sent by mail is seldom lost if properly enclosed. An excellent method is that of opening the layers of a card, placing the coins between the layers and sealing the edges together.

1852. 1865.

Thirteenth Year of Publication.

THE GOLDEN ERA,

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty six columns containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in the Golden Era.

The most popular Novels of the present day are published as Serials, from week to week, in THE GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the Contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California, and on the Pacific Coast; also correspondents and contributors of distinguished talent in the Atlantic States and Europe; including "Orpheus C-Kerr," Fitz Hugh Ludlow, G. B. Densmore, "Mark Twain," Dan De Quille, Florence Fane, Miss Emma Hardinge, Sarah E. Carmichael, Annie E. Fitzgerald, "Occasia Owen," Alice Mason, William Simpson, Chas. F. Stoddart, "Ina," H. C. Williston, "Albion," "Fairfax," Bonnevel, Mary Kyle Dallas, Margaret Rosmer, and many other accomplished writers of Fiction, Romance, Novels and Stories, Poetry, Essays, Sketches, etc., etc., comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States or Europe.

THE GOLDEN ERA TO CLUBS.

Parties (living remote from localities where agents are located) forming a club of five yearly or half-yearly subscribers, and forwarding the subscriptions (by letter registered and postage paid) to the office of publication in San Francisco, will be entitled to an additional copy of The GOLDEN ERA for the term of one year, or to retain the equivalent in cash.

AGENTS in every part of the State receive subscribtions for the GOLDEN ERA.

POSTMASTERS in California, Oregon, and neighboring Territories, obtaining subscriptions for the GOLDEN ERA and forwarding the same, with name and address of the subscriber, will be allowed a commission therefor.

PARTIES residing in localities where no Agents are established will forward their subscriptions by mail.

SUBSCRIBERS will be careful in writing as plainly and fully as possible, the direction of papers to be sent to any part of California, the Atlantic States, or elsewhere.

Now is the Time to Subscribe.

TO ADVERTISERS!

Best Advertising Medium—The "Golden Era" is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village, and mining and agricultural precinct in California, and offers unusual and unequaled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

GOLDEN ERA POSTAGE.

POSTAGE on the GOLDEN ERA, to Mail Subscribers, in California and throughout all the States and Territories of the Union, per quarter, (3 months).... 5 cts.
To be paid quarterly, in advance, either at the Office of Mailing or Delivery.
POSTAGE on the GOLDEN ERA, Single Copies, transient, to be prepaid by stamps..... 2 cts.
POSTAGE on the GOLDEN ERA, to Mail Subscribers in the county (San Francisco) where published..... Free.

TO MAIL SUBSCRIBERS.

The Golden Era, for One Year..... $4 00
The Golden Era, for Six Months..... $2 00
The Golden Era, for Three Months..... $1 00

Subscriptions to be Paid in Advance.

BROOKS & LAWRENCE,

GOLDEN ERA BUILDING,

543 Clay st., near Montgomery, San Francisco.

A MINING COMPANY'S AFFAIRS.—Some time in November a committee of the stockholders of the Overman Mining Company was appointed to examine into the affairs of the concern. They report the result of their examination as below:

"The investigation shows the debts of the Company to amount to $81,848.92. Its assets are $69,479.66, being due for delinquent assessments and on stock hypothecated and subsequently sold. The receipts of the Company have been $255,234.24, while the expenditures have amounted to $263,777.05. The principal accounts of expenditures are: Labor, $83,-162.14; legal expenses, $37,690.27; loss on stock, $27,898.40; lumber, $20,909.39; machinery, $19,880.97; interest account, $14,-232.75; secret services, $17,843, etc. By the statement it appears that the excess of liabilities over the assets amounts to $12,369.26. The total proceeds of bullion from the mine amounted to $23,619.43."

HOW TREES GROW.—Trees are made up of fine tubes which extend from the root to the leaf, and it is through these tubes that the circulation of the sap is carried on. If a growing tree is pulled up by the roots, and the roots are placed in a vessel of water containing some colored solution which they will absorb, we can trace the course of this colored solution through the tree by cutting notches into it at successive periods. The coloring matter is always found first in the body of the wood near the root, then in the wood higher up, and so on until it reaches the leaf, then it begins to appear in the inner bark near the leaf, and it passes down through the bark again to the root. This observation shows that the circulation of the sap is up through the wood and down through the bark.—*Scientific American.*

GRAFTING ANIMALS.—The *Intellectual Observer* says: "Dr. Paul Bert has published a work on the curious subject of animal grafts. He succeeded in making Siamese twins of a couple of rats, and in many other monstrosities. He exclaims, 'It is a surprising spectacle to see a paw cut from one rat live, grow, finish its classification, and regenerate its nerves under the skin of another, and when we plant a plume of feathers under the skin of a dog, what a miracle to see the interrupted vital phenomena resume their course, and the fragment of a bird receive nourishment from the blood of a mammal.'"

EXCELLENT YEAST.—Cook a handful of hops in a half gallon of water, until it is reduced to about half; pass the liquid through a sieve and turn it while hot upon enough flour to make a thick porridge, and when nearly cool, add a pint of brewers' or other yeast, and set the vessel in a warm place until it rises. This yeast will be fit to use in about twelve hours. It should be put into a well-closed jug and kept in the cellar. In using it, a pint should be kept with which to make a new quantity when needed. If a couple of potatoes, boiled and mashed fine, are added to the batter while warm, it will be found to improve the bread, in moisture and sweetness.

THERE are now about 115,000 miles of railway in the world, which has consumed 40,000,-000 tons of iron.

For Advertising Assessments on Saturdays.

Levy your Assessments upon any day EXCEPT FRIDAY.

Advertise the ASSESSMENT NOTICE on the FIRST FOUR SATURDAYS succeeding the day upon which the assessment is levied.

Appoint the day for advertising the DELINQUENT SALE on the FIFTH SATURDAY succeeding the date of levying the assessment.

Appoint the DAY OF SALE on the SEVENTH SATURDAY succeeding the date of levying the assessment, or any day *previous* to the Eighth Saturday.

Assessments ordered upon Saturday afford the Secretary the longest term in which to effect his advertising at the mine.

Extracts from the Statutes.

The attention of companies who desire advertising their delinquent sales in any other paper than that in which the notice of assessment appears, is called to the following section of the law approved April 4th, 1864:

Section 7. If any portion of the assessment mentioned in said notice shall remain unpaid on the day specified therein for the publication of the notice of sale, the Secretary shall, *unless otherwise ordered by the Board of Trustees*, cause to be published in the same papers in which the notice provided for in section five shall have been published, a notice substantially as follows, &c.

If, from a matter of convenience or necessity, the publication of an assessment is delayed, a very simple remedy is found in the following section of the law, relating thereto:

Section 14. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the nonperformance of any act required to be performed in order to enforce the payment of the same; but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall be void, and publication shall be begun anew.

To Mining Secretaries.

We positively refuse hereafter to receive advertisements of any mining company for the payment of which the Secretary is unwilling to vouch. We shall also exercise the right to eject from our columns, at any time during the course of publication, any advertisement for which payment is not made, or security given upon proper notification.

TEETH

☞ **Extracting Without Pain.** ☜

Drs. Whitcomb & Dyer,

DENTISTS,

[Successors to W. H. Irwin.]

No. 205 Third Street, near Howard,

18-v9 SAN FRANCISCO.

The uniformed and drilled militia of the State now numbers one hundred and forty-seven companies in all, of which twenty are cavalry and five artillery. These companies, says the *Bee*, will average about forty-five members each, making an aggregate military force, ready for service, if necessary, on twenty-four hours' notice, of six thousand six hundred and fifteen men.

Trunk hardware is almost entirely an American product, and a distinct branch of the hardware manufacturing business. It consists of locks, rivets, nails, rollers, silvered gilt and japanned ornaments of various kinds, bag frames, steel and brass bands, buckles and hinges. One Connecticut establishment furnishes nearly all the locks used in the trade.

Literary Ballooning.—The Philadelphia *Inquirer* says: "The greatest literary novelty of any age transpired the other day. Elmer Brian Coates made a balloon ascension, with Professor Low, in the Quaker City. While in the sky he wrote a poem of one hundred lines, entitled a 'Balloon Poem.' This is something heretofore unattempted by any literary gentleman."

The Teeth.—Horace Walpole wrote: "Use a little bit of alum twice or thrice a week, no bigger than half your nail, till it has all dissolved in your mouth, and then spit it out. This has fortified my teeth, that they are as strong as the pen of Junius. I learned it of Mrs. Grosvenor, who had not a speck in her teeth till her death."

Private letters from La Paz, Arizona, say that the steamer Esmeraldn, Captain Trueworthy, has been chartered to carry a large load of freight for Salt Lake, through the Black Cañon, hitherto considered head of navigation on the Colorado, and as far as possible in the interior.

An English paper says: "Rust eats fast into wrought-iron structures. This year no less than forty tons of iron rust were taken out of the Menai tubular bridge at the thorough cleaning." At that rate it will soon be carried away in old iron.

Marble.—The Columbia Courier says a new quarry of marble has recently been discovered near that town. It is elegantly colored with veins of blue, green, black and pink, and as it readily takes a fine polish, will be most valuable for mantles and other ornamental work.

The Idaho *World*, of the 17th ultimo, says that the Gambrinas quartz mine near Idaho City yielded 1,021 pounds of amalgam from 252 tons of quartz, or nearly $400 of gold per ton of rock. The gold, when retorted, is 695 fine, and is worth $14 36 per ounce.

IMPORTANT DISCOVERY
—IN THE—
Photographic Art.
Jacob Shew's
CHROMATIC PROCESS OF PRINTING PHOTOGRAPHS.
[PATENT APPLIED FOR.]

THE UNDERSIGNED WOULD ANNOUNCE TO THE public that he has discovered a new and IMPROVED PROCESS for printing Photographs, which produces a

SOFTNESS, CLEARNESS AND DELICACY OF TONE

unattainable by any other known process and to which he has given the above name. It is applicable to any size of Photograph, and those having valuable old negatives which they desire printed by the improved process can do so at any time.

In order to secure the pecuniary advantages to be derived from this important discovery a patent has been applied for. When obtained, the privileges of the right will be disposed of at a reasonable rate to any Photographer desiring it. In the meantime all are warned against encroachments upon the rights of the discoverer as such will be prosecuted to the full extent of the law.

"Cartes de Visite" and large Photographs printed by this process will be furnished at the prices of the ordinary work of other establishments.

☞ The public are invited to examine specimens at my Gallery. ☜

LEWIS COFFEY. J. S. RISDON
LEWIS COFFEY & RISDON,
Steam Boiler & Sheet Iron Works
THE ONLY EXCLUSIVELY BOILER MAKING ESTABlishment on the Pacific Coast, owned and conducted by Practical Boiler Makers. All orders for New Work, the repairing of Old Work, executed as ordered, and warranted as to quality.
Old Stand, corner Bush and Market Streets. Opposite Oriental Hotel, San Francisco, Cal.

SPLITTING A COW'S TONGUE.—Henry Bill, New London county, Connecticut, bought an Alderney cow very cheap because she would milk herself, which nearly destroyed her value as a milch cow. By the advice of a neighbor, who performed the operation, he split the end of her tongue. The cut is two inches long, just starting the blood at the beginning, but cutting clean through at the tip for three-fourths of an inch. He reports, "It worked like a charm; I have no further trouble with her." The reason why it is effective is obvious to any one who has ever let a calf suck his finger; and noticed the clasping pressure of the tip of the tongue.

DURING the Revolution, with a population of 3,000,000, there were 395,000 men called into service. If the same proportion were called out now, we should have an army of 4,000,000.

THE Pacific Steam Navigation Company of Liverpool, England, are having a beautiful side-wheel steamer built in New York, which is intended to be the fastest steamer of her length in the world.

THE people of Parkersburg Va., have forgotten all about the war and have gone mad upon the subject of oil, which has been "struck" extensively in their neighborhood.

Machinery.

IMPORTANT INVENTION.

Hunter's Concentrator, Amalgamator and Separator.

For the concentration of Gold, Silver and Copper ores, and separating all kinds of metals from the sands, where the specific gravity of the metal is greater than that of the rock, a machine is now on exhibition at the SAN FRANCISCO IRON WORKS, N. E. corner of Mission and Fremont streets, where it will be running from two to three o'clock P. M., for the inspection of all interested in mining. The Inventor is prepared to manufacture machines to supply all orders promptly. The sixth of a horse power is sufficient to run one of these machines. For the above machine a patent has been applied for. Orders for machines, or for circulars and further information, should be addressed to

ANDREW HUNTER, Inventor.

The following extracts from Reports are submitted to the public as giving the results of a fair working test of these machines:

BEAR VALLEY, DEC. 12, 1864.

MR. A. HUNTER—*Dear Sir:* I take pleasure in stating, in reply to your request, that your concentrator has now been running uninterruptedly, at Princeton Mill, for more than three weeks, and the enclosed notes, by the Superintendent Mr. Williams, of a carefully measured test of its performance during a period of a day and three-quarters, I believe fairly indicates what it has been doing through the whole of that time. First, the loss of the sulphurets, per cubic foot of tailings from the Concentrator, was about one-tenth of an ounce. Second, the loss of sulphurets from the blankets was nearly *fifteen times greater* than that from the Concentrator. The Concentrator has not been found at any time in the slightest manner out of order, and has required scarcely any attention. Congratulating you upon the these facts, I am, sir, very respectfully yours, FRED. LAW OLMSTEAD, Manager Marlposa Company.

Notes of test run of Hunter's Concentrator—It having been supplied during the test with the sands reduced by one battery of the Princeton Mill, in the condition in which they are usually received by the blankets:—

Running time	1¾ days.
Amalgam saved on the plates of the Separator during above time, value	$6 75
Rate of saving of single machine per day	3 86
Rate of saving of six machines per day	23 16
Yield of Sulphurets, 1¾ days, pounds	215
Yield of Sulphurets, one days run of one Machine	123
Rate per day of saving from six machines, being the whole number required for the Princeton Mill	738
Yield of amalgam from plates of Separator, per ton of rock crushed, value	55
Yield of sulphurets from Separator per ton of rock crushed, pounds	18

HANNIBAL WILLIAMS, Superintendent Princeton Mill.

SAN FRANCISCO, DEC. 18, 1864.

I have recently examined one of Hunter's Concentrators and Amalgamators, in operation at the Princeton Mill, Mariposa Estate, the sand and crushed rock, flowing from one battery of four stamps, passing directly over the machine, without using blankets. On examination, it shows conclusively that the loss of sulphurets by the machine is much less than by the blankets, being but a mere traction of the sulphurets, consisting of the light and thin scales, such as can scarcely be saved. On the other hand, the tailings from the blankets contain a large amount of heavy sulphurets. The product of the machine is almost pure, clean sulphurets—the copper plates of the machine, being amalgamated, securing much or all of the free gold that escapes the battery. I witnessed the cleaning up of the machine, and the collection of a ball of amalgam. From the weights taken we may state the constitution of this ore, as it came from the batteries at that time, as follows:

Clean Sulphurets containing free gold and amalgam	18.09
Quartz sand, waste	981.78
Loss of Sulphurets and tailings	.22
Total	2000.00

WM. P. BLAKE, Professor of Mineralogy, Geology and Mining, Mining and Agricultural College, California.

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concreto; Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Grinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water, or Steam Power. For further information address W. W. HANSCOM.

I Golden State Iron Works, San Francisco.

Pacific BEATER PRESS Company.

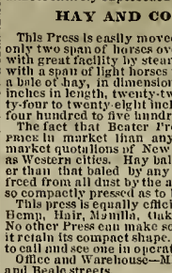
SAN FRANCISCO, CALIFORNIA.

This Company are prepared to manufacture and sell the celebrated PORTABLE BEATER PRESS, so well known in the East, where it has, in the short space of two years, almost entirely superseded all other

HAY AND COTTON PRESSES.

This Press is easily moved from place to place, requiring only two span of horses over any ordinary road; is worked with great facility by steam or water power; and two men with a span of light horses in ten minutes time will turn out a bale of hay, in dimensions measuring three feet eleven inches in length, twenty-two inches width, and from twenty-four to twenty-eight inches in depth, and weighing from four hundred to five hundred pounds.

The fact that Beater Pressed hay commands a BETTER PRICE in market than any other, is substantiated by the market quotations of New York and other Atlantic as well as Western cities. Hay baled with this press is much cleaner than that baled by any other in use, being completely freed from all dust by the action of the beater, besides being so compactly pressed as to be fire and water proof.



This press is equally efficient for Cotton, Wool, Pulu, Tow, Hemp, Hair, Manilla, Oakum, Hops, Rags, Shavings, &c. No other Press can make so good a bale of cotton, and make it retain its compact shape. Parties interested are invited to call and see one in operation.

Office and Warehouse—MISSION STREET, between Main and Beale streets.

W. H. MITCHELL,
General Agent.

10v-2

HUNT'S IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

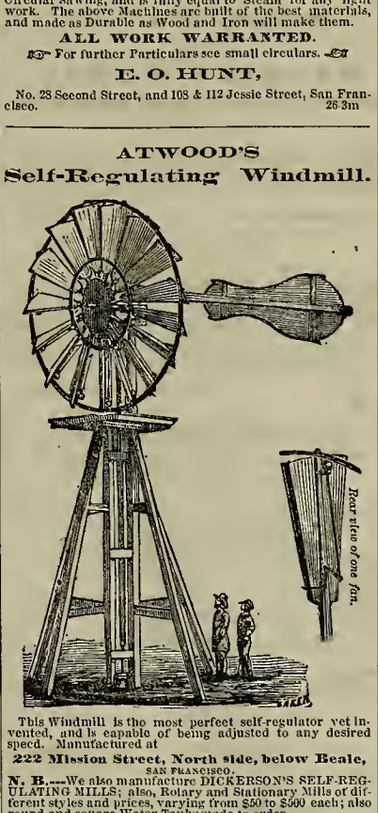
HORSE POWER

For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.



ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

E. O. HUNT,

No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

ATWOOD'S Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

DUNBAR'S PATENT SELF-ADJUSTING Piston-Packing.

Requires no Springs or Screws; Is always Steam Tight, without excessive friction, and never gets slack or leaky.

IT WILL SAVE EACH SEASON MANY TIMES ITS COST in friction, time, steam and power. No engine, old or new, should be without it. It can be easily fitted to old or new Pistons.

Having obtained the Agency of this VALUABLE IMPROVEMENT, I am prepared to furnish it wherever desired. For further information, address HENRY S. SMITH,

23v8 Golden State Iron Works, San Francisco.

HUNT'S NEW DITCHER.

HAVING SECURED FROM THE INVENTOR THE SOLE right to manufacture these Machines for the States of California and Oregon, and the Territory of Washington, I am now prepared to receive and promptly fill orders for these machines.

With the aid of three men and four horses this Machine will cut a ditch from two to three feet deep, as may be desired, dumping the earth all on one side so as to form a dike or embankment. For particulars send for circular, to

E. O. HUNT,

THE NOVELTY.

This ROTARY CYLINDER GRINDER & AMALGAMATOR *did not receive* the premium at the Industrial Exhibition. The one there displayed worked one hundred pounds at a charge, and was classed merely as a model, honorable mention of which being made by the committee. The inventor is now manufacturing some of the larger size of this machine, capable of working Two Thousand Pounds at a charge, and requiring no more power than is necessary for the pans now in use working but one-third that amount. This machine is simple in construction, durable and compact, very easy to clean up, and, in fact, is a perfect machine.

In offering his Amalgamator to the mining public the Inventor does not claim to have found the "Philosopher's Stone," nor any new method of extracting the precious metals from the ores, but does claim, as a practical mechanic and worker on mining machinery, that there was room for improvement in that direction, and that he has, by careful study, invented his improved ROTARY CYLINDER GRINDER AND AMALGAMATOR, known as the "NOVELTY," which mechanically overcomes the many difficulties that have heretofore arisen in the art of amalgamating ores.

This invention consists of a cylindrical-shaped case placed horizontally on legs, and provided with dies one and a half inches thick, making seventeen square feet of grinding surface, and having a rotary oblique muller (one or more) placed within it, and covered with shoes one and a half inches thick, and so constructed that all particles of rock must pass between the shoes and dies, causing it to be thoroughly reduced. The process of amalgamation is similar to that of the German Barrel, but much more rapid than that or any other amalgamator, as the muller gives three distinct motions to the pulp in one revolution. Heretofore, the chief objection to cylinder amalgamators has been the great wear and friction to which the journals were subject; but in this amalgamator that difficulty has been entirely overcome by the use of an adjustable metallic box, a new invention, that acts for the double purpose of a metallic packing and a journal box, and works to perfection.

This machine, when seen working will convince any practical man of its superiority over all others, and the public in general, and Miners and Millmen in particular, are invited to call and examine these machines, now in operation at the Miners' Foundry, where they are now being manufactured. Address, Miners' Foundry, San Francisco, Cal.

H. L. HOPKINS,

10v1 Inventor and Patentee.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the **PACIFIC FOUNDRY,**

10v1 San Francisco.

SALMON'S PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

No.	Fine	No.	Fine
Assay.....250	945	Assay 300	990
Assay.....285	941	Assay for Cazeman	980
Assay.....286	940	Assay Water Rock	966
Assay.....291	950	Assay Water Rock	993
Assay.....		.....St. Helena Ledge, W. D.	966

These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,

To whom all orders should be addressed. 15

Hepburn & Peterson's AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Knstel Bros. works, Bryant St. between 3d and 4th.

Illustrated in the Mining and Scientific Press, April 9th, 864.] HEPBURN & PETERSON.

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give any attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. **B. FAUCHERY,** Engineer,

9v24

FARRAND'S Oscillating Amalgamator,

RECEIVED THE

ONLY PREMIUM

AWARDED FOR AMALGAMATORS

At the Recent Industrial Fair

OF THE

Mechanics' Institute of San Francisco.

Committee of Awards.

O. BELDEN, O. GOR, W. T. GARRATT, GEO. JOHNSON, H. P. WAGELEE, C. M. RADCLIFF.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

W. D. FARRAND, Inventor,

R. L. OGDEN, Agent, SAN FRANCISCO.

S. E. corner Montgomery and California streets.

v9-19

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Stephens, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15-1m

PRATER'S PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.

San Francisco, April 1st, 1864. 14v8-tf

Disney's Cylinder Amalgamator.

The Cheapest and Best.

DISNEY'S CYLINDER AMALGAMATOR, WHICH HAS recently been introduced to the public, has already been proved a complete success, and can be furnished, at a price cheaper than any other in use. It is simple in construction, and so arranged as to do a large amount of work with the smallest expenditure of power. The proprietor is satisfied that he can do more work in a given time and with a given expenditure of power than any other amalgamator in use. For small companies who desire cheap yet effective machinery none can be more desirable.

It may be seen in operation at the Rail Road Foundry on Fremont street where

A NEW CRUSHER

Is in operation and he can crush and Amalgamate at the LOWEST RATES. Miners and all others interested are invited to call and examine for themselves.

M. DISNEY, Patentee.

W. L. KIRBY, Secretary.

Office, Room 8, No. 611 Clay street, San Francisco. 3-v10

HISTORICAL PARALLEL FOR SHERMAN'S CAMPAIGN.—We notice that many of our contemporaries are hunting the military records of the old world for parallels for Sherman's great march. It has been compared with Napoleon's march to Moscow, and the kindred ill-fated enterprise of Charles the Twelfth. But, says the Chicago Tribune, a far closer resemblance is found and elaborately maintained by the Providence Journal, in the famous and triumphant advance of Wellington, in the Summer of 1813, from Portugal to the Pyrenees and the Bay of Biscay. He gathered his immense army on the Douro, and as it crossed the boundary of Spain, the great commander in his enthusiasm rose in his stirrups, and waving his hand, exclaimed, "Farewell, Portugal!" He cut loose entirely from his base of supplies at Lisbon, and started for the ports in northeastern Spain, where a British fleet and British transports could come to his aid. But he had to fight his way. King Joseph, Napoleon's brother, with his army was before him. History tells how the great captain, by brilliant strategy, severed the connection of the French with the coast, drove them up the rugged valleys of the Douro, reached the ports of Santander and Bilboa, obtained his supplies, won a crowning victory at Vittoria, and thus delivered Spain from the rule of the Freuchmen. This Wellington did, having left a base on one coast for a new base on another coast, to reach which he marched one hundred thousand men six hundred miles in six weeks, fighting as he went. The movement of Sherman will be in history the twin in conception to that of Wellington, and may gain a closer resemblance in its victories and results.—*Exchange.*

ACCORDING to its voting population, San Francisco appears to be the sixth city, in size, in the Union. New York, Philadelphia, Brooklyn, Cincinnati and Chicago only cast more votes than San Francisco.

Two hundred and fifty-seven acres of land, in a certain portion of West Virginia, were worth, two years ago, two hundred and fifty-seven dollars. Two weeks ago a million and a quarter of dollars were paid for the same land. "Struck oil."

A letter from a traveller in the new oil regions of Penosylvania says: "We were paddled across the creek by an oil prince, aged fifteen, heir to a million, coatless and hatless, and with but one suspender to keep his courage and his trowsers up."

M. Mary, a Frenchman, has invented a system of teaching the deaf and dumb to talk. He tells them with his hand how to form the mouth and place the tongue, and when they get the right sound makes them repeat it till they remember it.

IN Dauphine, France, so it is said, they make bread but once in six months, and bake it with the refuse of the fields. In the winter it becomes so hard that they cut it with an axe, and soak it for twenty-four hours before they can eat it.

A LETTER from Edinburgh, the centre of the great publishing houses of Scotland, declares that the days of Quarterly Reviews are ended, and supports that statement by a reference to the declining condition of many leading publications of this class.

A Jerseyman has invented a machine to cut and twist Manila paper into strips so as to serve as a substitute for cotton twine. It answers admirably, is better than hemp, and much cheaper than cotton twine.

Notice.

OFFICE OF THE COUNTY CLERK }
CITY AND COUNTY OF SAN FRANCISCO. }

In the County Court of said City and County:

Notice is hereby given, pursuant to law and an order of the Hon. Samuel Cowles, County Judge of said City and County, this day made, that "La Morronena Silver Mining Company," a Corporation organized and doing business in said City and County, has made application, by petition this day filed, that said Company be disincorporated and dissolved; and that such application will be heard by and before the Honorable the County Judge of said City and County, on the 31st day of January, 1865, at 10 o'clock in the forenoon of that day, at the chambers of the County Judge, in the City Hall Building, in said City and County.

Witness my hand and the Seal of said County Court, this 30th day of December, A. D. 1864.

{Seal and 50 cent stamps cd}

WM. LOEWY, COUNTY CLERK.
By J. NAFTALY, Deputy County Clerk.

Mining Notices--Continued.

Ashland Mining Company, Moss Lode, San Francisco District, Arizona.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 6th day of January, 1865, an assessment of fifty cents per share was levied upon the capital stock of said company, payable on the 30th day of January, 1865, in United States gold and silver coin, to the Secretary, at his office, No. 613 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Monday, the 30th day of January, 1865, will be advertised as delinquent on Saturday, the 4th day of February, 1865, and unless payment shall be made before, will be sold on Saturday, the 18th day of February, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. T. KNOX, Secretary.

Office, No. 613 Montgomery street. jan7-1-4

Agawam Gold and Silver Mining Company,

Nye County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 4th day of January, 1865, an assessment of one dollar per share was levied upon the Capital Stock of said Company, payable on the 7th day of January, 1865, in United States gold coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 11th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Friday, the 3d day of March, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

G. M. BURNHAM, Secretary.

Office, No. 509 Clay street, San Francisco. jan7-1-4

Animas Silver Mining Company, Ventanas, District of San Dimas, State of Durango, Mexico.

NOTICE.—There are delinquent upon the following described stock, on account of Assessment levied on the 3d day of December, 1864, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Trustees, made on the 25th day of November, 1864, so many shares of each parcel of said Stock as may be necessary, will be sold at the salesroom of Mauriee Dore & Co., No. 327 Monigomery street, San Francisco, on the 20th day of January, 1865, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

RALPH EMERSON, Secretary.

Office, Room 5, No. 540 Clay Street, San Francisco. 27

Evening Star Gold and Silver Mining Company, Trinity District, Humboldt County Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of the said Company, held on the 21st day of December, 1864, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said Assessment shall remain unpaid on Saturday the 28th day of January, 1865, will be advertised on that day as delinquent, and unless payment shall shall be made before, will be sold on Saturday the 11th day of February, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

N. DUPERU, Secretary.

Office, No. 710 Sansome street, San Francisco. dec31-27-4

Great Western Tunnel and Mining Company, Aurora, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 5th day of January, 1865, an assesment of twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assesment shall remain unpaid on Saturday, the 4th day of February, will be advertised as delinquent, and unless payment shall be made before, will be sold on Monday, the 20th day of February, 1865, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

JOS. C. FORD, Secretary,

Office, No. 21 Exchange Building, corner of Washington and Montgomery streets, San Francisco. jan7-1-4

Good Hope Gold and Silver Mining Company, Alpine District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 2d day of January, 1865, an Assessment of fifty cents per share was levied upon the Capital Stock of said Company, payable on the 30th day of January, 1865, in United States gold and silver coin, to the Secretary, or to H. MORRIS, in Markleeville. [*Delinquents will be held for accruing costs after the 30th of January.*]

Any Stock upon which said assessment shall remain unpaid on the 30th day of January, 1865, will be advertised as delinquent on Saturday, the 4th day of February, 1865, and unless payment shall be made before, will be sold on Saturday, the 18th day of February, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

PRESTON MORRIS, Secretary.

Office, No. 526 Montgomery street, San Francisco. [1-4

George Washington Gold and Silver Mining Company, Silver Mountain, California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 12th day of December, 1864, an assessment (No. 3) of 50 cents per share was levied upon the capital stock of said company, for the months of December and January, payable immediately to the Secretary, or to S. A. HAWKINS, Superintendent, at Silver Mountain.

Any stock upon which said assessment shall remain unpaid on Saturday, the 21st day of January, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 4th day of February, 1865, at the office of the company.

Assesment No. 4 of 50 cents per share, for the months of February and March, 1865, due and payable as above on the 13th day of February, 1865. Any stock upon which said assessment shall remain unpaid on the 11th day of March, 1865, will be advertised on that day as delinquent, and sold on the 25th day of March, 1865, at the office of the company. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.

Office, No. 430 Montgomery street, San Francisco. 25

Good Return Consolidated Gold and Silver Mining Company, Inyo District, Tulare County, Cal.

A Meeting of the Stockholders of the above named Company, for the election of Trustees for the ensuing year, will be held on Monday, January 23d, at 2 o'clock P. M., at the office of the Company, No. 728 Montgomery street, San Francisco. By order of the Board of Trustees.

2-2 N. G. FRENCH, Secretary.

Kelsey Gold and Silver Mining Company, Kelsey District, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 9th day of January, 1865, an assessment of fifteen cents per share was levied upon the capital stock of said Company, payable on the 10th day of January, 1865, in United States gold and silver coin, to the Secretary, at his office, in the city of San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday the 11th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday the 27th day of February, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

WILLIAM VALE, Secretary.

Office, No. 36 Exchange Building, N. W. corner of Montgomery and Washington streets, San Francisco.

ja14-2

Mount Davidson Gold and Silver Mining Company, Virginia District, Storey County, State of Nevada.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 11th day January, 1865, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, Room No. 53 Montgomery Block, San Francisco.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 11th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 27th day of February, 1865, to pay the delinquent assessment thereon, together with costs of advertising and exponses of the sale. By order of the Board of Trustees.

W. FELL, Secretary.

Office, No. 53 Montgomery Block, San Francisco. Cal.

INVENTORS AND INVENTIONS.—Let us not cheapen inventions, but be kind to the inventors; beware of killing the goose that lays the golden egg! Many inventors die before the hour of triumph; others falter by the way. Invention is a struggle, a conflict, almost a battle; if the victors are rewarded, the dead are honored and the wounded carefully attended to. Clothe the inventors who succeed; cover with an indulgent self-respect the faults of those who fail; and soothe the last years of the wounded—those invalids of industrial science who have known only the pains of the fight, and always remained ignorant of the joys of victory. —[Dumas.

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the MINING AND SCIENTIFIC PRESS. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

SCIENTIFIC AND MINING JOURNAL.—This is as valuable a publication as is produced on the Pacific Coast, and one which interests all parties. It contains much that is instructive and entertaining, and seems to have the right men at the head of its affairs.—*Spirit of the Times.*

Mammoth Gold and Silver Mining Company, Silver Mountain District, California.

MINING AND SCIENTIFIC PRESS.—This well conducted journal has entered upon its ninth volume. It is a sterling periodical, and deserves encouragement.—*Territorial Enterprise.*

New Era Copper Mining Company, Salt Spring District, Tuolumne County, California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 3d day of January, 1865, an assessment of twenty-five cents per share was levied upon the capital stock of said company, payable on the 1st day of February, 1865, in United States gold and silver coin, to the Secretary.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 4th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 18th day of February, 1865, to pay the delinquent assessment, together with costs of Advertising and expenses of the Sale. By order of the Board of Trustees.

C. B. TOWLE, Secretary.

Office, S. W. Corner of Stockton and Washington streets, San Francisco. jan7-1-4

North Superior Copper Mining Company, Union District, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 23d day of December, 1864, an assessment of forty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary at the office of the Company, No. 338 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the 21st day of January, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 4th day of February, 1865, at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, California, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

T. B. STIERMAN, Secretary.

Office, Room 12, No. 338 Montgomery street, San Francisco, California. dec24-26-4

POSTPONEMENT.—The advertisement of stock delinquent on the above assessment, is postponed until Saturday, the 28th day of January, 1865, and the sale thereof is postponed until Saturday, February, 11th, 1865. By order of the Board of Trustees. T. B. STIERMAN, Secretary.

Memorandum for Secretaries.

Safe Rules for Advertising.

Make your order levying the assessment on any day EXCEPT FRIDAY, and advertise the Assessment Notice on the FIRST FOUR succeeding SATURDAYS, setting the day for delinquent advertising on the FIFTH SATURDAY, and the day of sale on the SEVENTH SATURDAY, or any day thereafter, PREVIOUS to the EIGHTH SATURDAY.

ADVERTISING IN THE INTERIOR.—If the mine or works of the corporation are located in any State or Territory of the United States, notice must be advertised there also, if a newspaper is published in the same county. On this account, SATURDAY is the best day on which to levy assessments, as thereby the longest period possible is gained for transmitting a copy to interior papers, which are usually published on Saturdays.

POSTPONEMENTS.—The date set for advertising delinquent stock, and the day of sale mentioned in either notice, may be *once* postponed for any period not to exceed ten days. Secretaries can avail themselves of this privilege when assessments are levied on Friday and they are obliged to advertise at the mine on Saturday, or desire to publish on that day at the place of incorporation.

ERRORS, OMISSIONS, OR DELAYS are definitely provided for in Section 14 of the new law, whereby it is plain that, if the advertising is delayed, the Secretary can only fix the dates for delinquent advertising and sale to suit the time he is to advertise, and proceed anew.

WHEN PAYABLE.—It is the usual custom to make the assessment "payable immediately," or upon some date within a day or two from the time of levying the assessment, although the law makes no requisition as to this matter.

BLANKS FURNISHED FREE to advertisers in the MINING AND SCIENTIFIC PRESS, for Assessment Notices, Delinquent Sales, Postponements, etc.; also copies of the Assessment Law of 1864. Copies of advertisements, for sending personal notice to shareholders, printed at $1 per hundred.

The PRESS is the most ECONOMICAL advertiser for stockholders, reliable and obliging for Trustees and Secretaries, and merits the patronage of the mining interests.

¶ ¶ ¶ ¶ ¶ ¶ ¶ ¶ ¶ ¶ ¶

The mining community begin to appreciate our reasonable rates of advertising, and are turning their patronage to the journal most properly entitled to receive it. The advantage to shareholders of having all mining notices concentrated in one mining journal, is obvious to all, and our terms have been established with a view to effect such a consolidation; and most companies having an object for publishing in any other particular paper, can consequently afford to have their notices appear in our journal also — EDS. PRESS.

New Mining Advertisements.

Simeon Rosenthal	107	10	10 00
Simeon Rosenthal (Standing in H Copps name)	11	10	10 00

And in accordance with law, and an order of the Board of Trustees, made on the 20th day of August, 1864, so many shares of each parcel of said stock as may be necessary, will be sold, at public auction at the salesroom of L. Keller & Co., No. 537 California street, San Francisco, on Saturday the 11th day of February, 1865, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

E. X. FIELD, Secretary.

Office, 423 Washington street, San Francisco. 3

Morning Star Gold and Silver Mining Company, Echo District, Humboldt County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 29th day of December, 1864, an assessment of one dollar and twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to J. W. Shanklin, Secretary and Treasurer, at the office of the Company, No. 625 Merchant street, U. S. Land Office Building, San Francisco.

This assessment is made subject to such credit for the stockholders as may have been allowed them on any payments of assessments, or expenses of incorporation, and the filing of the necessary vouchers on the same.

Any stock upon which said assessment shall remain unpaid on Saturday, the 25th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 17th day of March, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. W. SHANKLIN, Secretary.

Office, No. 625 Merchant street, San Francisco. 3-4

COPIES OF PATENT CLAIMS.—We will promptly furnish, for a moderate fee, a copy of the claim of any patent issued by the U. S. Patent Office since the year 1836, on receiving the full name of the patentee, nature of the invention, date of the patent, and address of the person desiring the information.

Black Rock Ledge Silver Mining Company,
Reese River Mining District, Lander County, Nevada.

Notice is hereby given that there will be a meeting of the Stockholders of the above the Company, at the office of the Secretary, on the 18th day of February, 1865, at one o'clock P. M., for the purpose of electing Trustees, and such other business as may come before the meeting.

J. E. PURDY, Secretary.

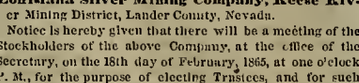
Office, Room No. 7, N. W. corner Front and Clay streets, San Francisco. 3

Louisiana Silver Mining Company, Reese River
Mining District, Lander County, Nevada.

Notice is hereby given that there will be a meeting of the Stockholders of the above Company, at the office of the Secretary, on the 18th day of February, 1865, at one o'clock P. M., for the purpose of electing Trustees, and for such other business as may come before the meeting.

J. E. PURDY, Secretary.

Office, Room No. 7, N. W. corner Front and Clay streets, San Francisco. 3



Henry Clay Silver Mining Company, Reese
River Mining District, Lander County, Nevada.

Notice is here by given that there will be a meeting of the Stockholders, of the above Company, at the office of the Secretary, on the 18th day of February, 1865, at one o'clock P. M., for the purpose of electing Trustees, and for such other business as may come before the meeting.

J. E. PURDY, Secretary.

Office, Room No. 7, N. W. corner Front and Clay streets, San Francisco. 3

W. T. GARRATT,
City
BRASS AND BELL FOUNDER,

Cor. Market and First Sts., opposite Oriental Hotel, SAN FRANCISCO.

Manufacturer of Brass, Zinc, and Anti-Friction or

Babbet Metal Castings;

CHURCH AND STEAMBOAT

BELLS,

TAVERN AND HAND BELLS AND GONGS,

FIRE ENGINES, FORCE AND LIFT PUMPS,

Steam, Liquor, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder, and Copper Rivets, &c. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles,

HYDRAULIC PIPES AND NOZZELS

For Mining purposes, Iron Steam Pipe furnished with Fittings, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."

☞ Highest Market price paid for OLD BELLS, COPPER AND BRASS. ☜ 6tf

TO MINE OWNERS.

REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Address **J. MOSHEIMER,**

Office, Nos. 14 & 15 Mead's Building, Corner of Pine and Montgomery Streets, San Francisco. 9v23tfq

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat, pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

Principal office, Brandreth Building, New York.

W. F. BRANDRETH.

10v2tf Office at Crane & Brigham's San Fran.

Mining and Scientific Press.

PETROLEUM—HOW AND WHERE TO FIND IT. NO II.

In our last issue we gave some general facts connected with the occurrence of petroleum in the Pennsylvania and Virginia oil regions, and in that of upper Canada, promising a continuance of the same this week, with a few "hints to prospectors," in relation to its occurrence in California. The space necessarily occupied to-day in completing our remarks on the Geology of Petroleum at the East, compels us to defer the consideration of its occurrence here, with our promised "hints to prospectors," until our next issue.

In passing, we would remark that the fact seems now very generally conceded that coal oil exists, in remunerative quantities, at intervals throughout pretty much the entire length of the California coast range of mountains, and just at this moment the danger appears to be that our people will rush into a coal oil mania, which, from our ignorance of what we are about to attempt, will prove quite as disastrous as the silver mania, from the effects of which we are just now recovering.

Even among Eastern prospectors and operators, the most crude, various and erroneous notions still prevail, generally leading to useless expenditures of capital and labor. From the best evidences at hand it would appear that the remunerative oil wells opened at the East bear about the same relative proportion to the failures, as the paying prospects for gold and silver on the Pacific coast do to the failures in our searches for the precious metals.

In entering upon a field of research so vast and important as the one now under consideration would seem to be, we should make broad the scope of our observation, and carefully examine every point of information attainable. It is only by such a course that we can act intelligently and avoid a repetition of the speculative mania which, during the past season, has brought sorrow and poverty to the doors of so many of our people, whose hard earnings had but just previously placed them in a condition of comfort and prosperity.

Scientific observations and explorations have not yet made sufficient progress at the East, to define even the alphabet of the origin and geology of petroleum. Many important facts have, however, been accumulated, and new developments are now looked for daily. Some of the closest and most earnest practical observers in the oil regions, have expressed the opinion that the operations of the present winter in Western Pennsylvania and Virginia, will do much to increase our knowledge of the science of seeking for petroleum.

The lowest geological strata in which petroleum has yet been found, is said to be in the fossiliferous limestone of Enniskillen, in Lower Canada, just north of Lake Erie, a location to which we particularly alluded in our remarks last week. The oil here found near and upon the limestone evidently had its origin in the marcellus shale, immediately overlying it, and about 150 feet thick. The country has been denuded of the superincumbent strata, which must have contained the coals from which the oil was derived, if indeed, it had its origin in coal. It is a matter of surmise with many, however, whether or not the oil, as here found, may not have had its origin (perhaps animal) in the shale itself, which is so highly charged with bitumen, as to have lead in times past, to expensive and useless explorations for coal. Passing upward in the geological series, we next find it in the Hamilton group of sandstone rocks, as they occur in the neighborhood of the lakes in western New York, a region abounding in oil and gas springs, about 1,000 feet thick. Above this group we have the black shales, or Geneses slate, of New York, 300 feet in thickness; then comes the Portage group of slates and sandstones 1,700 feet thick, which approach the surface and yield oil near Mecca and other places in Ohio. This is thought to be the third series of sandstone, which is the lowest reached by the deep wells of Oil Creek, Pa. Next above the Portage group, geologists have placed the Chemung group, composed mainly of thin bedded slates and limestones. These rocks are about 3,000 feet thick in Western New York, but only 1,000 where they are pierced by the wells at Oil Creek, Pa.

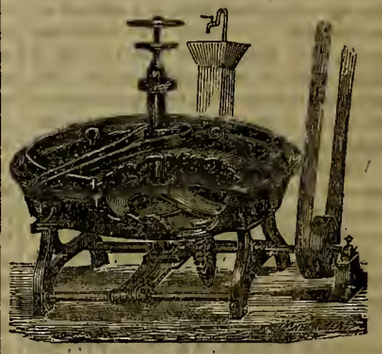
The entire group of rocks thus far enumerated are supposed to have been deposited beneath salt water. The same series occur in the county of Devonshire, England, where it is known as the Devonshire series. Oil is found on this Continent, in each of the series of rocks mentioned, but is not yet known to exist in any portion of the series in England. The next in the upward series of rocks is what is locally known as the Catskill group, which appears on the eastern flank of the Alleghanies, in Pennsylvania and Virginia, from 3,000 to 5,000 feet in thickness, and throughout which at intervals oil and gas springs are found.

We now have a vertical distance of rocks, measured according to their geological position, of about 10,000 feet, throughout which oil has been found. Of course, all these rocks have never been found in position at any one locality. For instance, at Enniskillen we find but 150 feet of rock overlying the limestone, all the superior rocks, to the extent of 850 feet, are supposed, at some time in the world's physical history to have held a position at Enniskillen, but by the action of water and other elements have been worked off, leaving nothing but the 150 feet of marcellus shale upon the limestone; while on the eastern flank of the Alleghanies, where we find the Catskill group upon the surface, we have good reason for believing that most, or all, the others mentioned would be found underlying, with a limestone at the base. Some of the series may be wanting; but where they do occur, it will probably be in the order given. Hence, geologically speaking, if the searcher for oil finds it upon or within the Catskill group, at any place, he may reasonably continue to bore until he reaches the limestone, hoping, at every strata he meets, to find a more abundant supply and a heavier and richer oil. So in the region of Oil creek—where the oil is found chiefly in the Chemung group—there is good reason to believe that the auger may yet be driven down some three thousand feet further to the limestone, when, in all probability, still larger reservoirs than have yet been met with will be found. This is what science teaches. The works now in progress will probably soon determine whether science, in this case, will be fully sustained by actual demonstration.

The rocks heretofore enumerated were all supposed to have been deposited beneath a salt sea, or ocean, and, of course, contain no oil. We now come to the true coal measures, or the formations, in which we may reasonably look for coal. These formations were deposited subsequent to the appearance of vegetation upon the earth, and out of the detritus of pre-existing rocks. Here, also, we find oil. These coal measures are estimated at a thickness of from 2,500 to 3,000 feet, and are divided into lower, middle, and upper measures. At Oil creek, these rocks have all disappeared, except some 600 feet, which remains, as caps, on the highest hills. But in Butler county, a few miles south, the lower series in which oil is found in the valleys and ravines, yield quite abundantly. Still further to the east and south, and approaching the mountains, on the banks of the Kiskimietas and Monongahela rivers, oil is found in the middle series, about 1,000 feet thick. At Marietta, Ohio, some 60 or 70 miles southwest of the Monongahela, the upper coal series is found also productive in oil.

We thus have a vertical distance in the geological scale of 14,000 feet, in any portion of which we may reasonably look for oil throughout the entire Atlantic oil basin, which was estimated, a year ago, at 200,000 square miles in extent, but which has since been very much enlarged by new and distant discoveries in Michigan, Indiana, and Illinois.

Over all this vast area, oil springs or surface indications of oil are found at intervals, and wherever they exist, there is reasonable hope for success in boring for oil. We shall have more to say of the extent and geography of the oil regions at the East in some future number. Enough is already known to establish the petroleum interest in the Atlantic States as one of the leading industrial features of the age, and the most grand and important discovery of the present century.



In our next issue we propose to give what is known with regard to the geology of the oil deposites of California, and to state the points of difference or similarity which exist between the oil producing rocks of the Atlantic and Pacific Coasts.

Chairs are manufactured at Stockton of California ash, white willow, and the bottoms of plaited tules.

BAUX & GUIOD'S SEPARATOR AND AMALGAMATOR.

We call the attention of quartz miners to the annexed engraving, of one of Baux & Guiod's Patent Separators and Amalgamators, claimed to be one of the greatest improvements in mining machinery ever introduced. This invention received the first prize at the Mechanics' Fair in this city in 1864, notwithstanding the most famous inventors of separators and amalgamators were competitors for the prize. Following we give the inventor's representation and description of the machine:

As may be perceived by reference to the cut, the mullers are so arranged that when in motion they cause the pulp to spread from the center to the outer rim of the pan, and with

such velocity that the particles of metal are injected into a column of mercury distributed around the pan, which the motion of the mullers causes to rise several inches from the bottom without coming in contact with the grinding surface of pan or muller. This peculiar arrangement, not to be found in any other separator or amalgamator, obviates the great source of loss in separating and amalgamating gold and silver from their ores—grinding the mercury. In Baux & Guiod's pans the mercury is not ground at all. The pulp from the battery passing into them from the bottom is thoroughly ground and then injected into the mercury, which *forces* the bullion to amalgamate without dividing the mercury. Another peculiarity of these pans, which secures the separation of the metals and the greatest possible division of the ore, is that the discharge of the waste is from an aperture in the center and top of the lid, while the motion of the grinders is at the very bottom of the pan. This arrangement prevents such heavy substance as gold, silver, and mercury from floating off even when very finely divided.

There is no reasonable doubt that these separators and amalgamators will be liberally introduced into our quartz mills, because their cost is less than others, while their capacity for working is equal to any, and their operations very perfect and reliable. They do away with grinding the mercury, which is the strongest argument that can be used in their favor.

Mill owners and miners will do well to give Baux & Guiod's Separators and Amalgamators a fair trial. Their address will be found in the advertising columns of our paper.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Metallurgy of Copper in California.

[By Paul D'Heirry, M. D., Mining Engineer, Professor of Chemistry and Metallurgy, Superintendent of the Copper Mining and Smelting Company, Queen of Bronze, Oregon.]

No. I.

GENERAL CONSIDERATIONS.

It appears that the time has arrived to make those who are interested in the production of copper, in the Pacific States, understand the importanee of this mining enterprise, and the means of arriving at profitable results.

If we assert that the produets of a *good* mine of eopper are immense, and that money will fiud in them a permanent and sure investment, we shall be replied to by this questiou :—

How comes it then, that they have been of so little profit in California?

It is to this that we will first of all answer.

At this time, the exploratiou of the eopper mines has arrived at a point which leaves no doubt concerning their permanence, their importance, and their richness. The Victoria, in Mariposa County, the Union in Calaveras, the Newton in Amador, the Superior in Plumas and the Queen of Bronze in Oregon, appear like rich landmarks tracing the great line of copper, whieh in a few years, will send forth its produets to all the markets of the world, and will take the place of the copper mines of Eugland, whieh are becoming exhausted.

But it is not everything to have in hand the rich treasures of Nature; it is requisite also to know how to derive advantage from them.

To send ores to the Eastern States or to Europe, as the poor Spanish populations have done up to the present time, is a sad and expeusive outlet, little worthy of an enterprising people, which justly claims to be the rival of the old world, in its industrial pursuits. But, apart from national pride, there are economieal considerations whieh completely condemn this deplorable system of exportation.

We see, in fact, that certain of our copper mines, of the first class, and whieh in every country in the world, would be regarded with admiration, and would make the fortune of their owners, mines which uowhere have their equals, are worked without profit and often with loss. Why?

It is because, after having horne the heavy expenses of extraction, it is necessary to reject immense quantities of excellent ores, and to ship none but those of an extraordiuary richness, while the clearest profit of the mine lies n the ground;

It is because it is necessary to make expenses, by costly bailing;

It is because it is neeessary to pay for long transportation by wagons, for freights of vessels, and the thousand expenses which spring up at each step on the passage to be made;

It is because it is neeessary to submit, without observation, to the assay of the agents at San Francisco—assays always less, by one and a half or two per cent., than the aetual value of the ores;

It is because it is necessary to undergo at Swansea the dry assay, which causes the further loss of one aud a half to two per cent. of the copper;

It is because it is necessary to pay tho interest of sums on the ores delivered.

And after all these charges are undergone, it is necessary of course, that the English smelter shall find his profit after having paid his expenses for reduction.

What then remains for the California miner? Ruin in the midst of wealth! Hence the reason why magnificent mines remain unproductive; hence, why we should leave this unfortunate courso that we have taken; hence, why, in fine, we should transact our business ourselves, in the production of copper.

We do not mean to speak here of the mines which incapacity and prodigality have ruined, or of those doubtful mines brought forward by the ra-cality of some und the stupidity of others, those mines belong to speculation, and not at all to the legitimate mining interest.

What we have said above is sensibly felt everywhere, and every one seems to try to quit this dependant and onerous position. It is in consequence of these powerful cousiderations, that the company, which owns the Queen of Bronze, has decided that works of reduetion should be ereeted near to this remarkable mine, the working of which, without them, would be onerous, if not impossible in the present eondition of things. We have also seeu with pleasure the Union undertake the reductiou of copper with a skill and prudeuce whieh will be a good exauple for the country, and whieh will do honor to those who manage the company, and to the experienced metallurgist who is employed. We were also pleased to notiee, by the last issue of the Press, that the owners of somo of the valuable mines in Plumas eounty, have quite recently erected exteusive smelting works, and are earnestly eudeavoring to thereby render their mines profitable.

Unfortunately the most of the companies who have mines of copper are without the general information and experience necessary to seeure a profitable management of their works; and those even who are capable of putting into execution the wishes of the compauies, are few in number, in this country, in which they are entirely eclipsed by pretended *savans*, who havo exhibited everywhere their eostly uselessness, and havc rendered the words "mineralogical science" almost odious to everybody.

It is with the intentiou of giving those who are interested a clear idea of the reduction of copper ores; it is with the intention of aiding our miners to quit the unfortunate road in which they have become mired, that we have concluded to publish a small treatise of the processes of reduction, which, we believe, to be the most likely to succeed in this country. Certainly a person will not become a metallurgist after having read our work, but he will learn to know the route to follow in order to arrive at success, and to escape the deceptions of charlatanism, and the exactions of speculators.

In order to render our work intelligible to all of our readers, we will avoid as much as possible making use of technieal expressions; we will give to our explanations all the clearuess possible, and we will aceompany the deseription of each operation by a sketch of the chemieal reactions wrought, and of the result towards which they tend; finally we will give calculations of eost as exact as possible. But before commencing this we think we should present some preliminary explanations, unnecessary, doubtless, for those who are learued, but which will be indispensable to the most of readers.

[To be Continued.]

[Written for the Mining and Scientific Press.]

Rolandson vs. Calvert.

Messrs. Editors.—While fully admitting the truth of the aphorism, that "coneeption must surpass attainment, or there would be no progress," and not disdaining, upon occasion, myself to take refuge behind it, I am still of the opinion that it is neither necessary nor conducive to the progress of science, that the efforts of any to that end should be criticized in a spirit of unfairness, or of personal or professional ill-will.

One would have thought, that the great distance of Prof. Calvert from San Francisco, would shield him, at least from injustice, yet, to one personally unacquainted with either of the parties, the remarks of "T. Rolandson, Fellow of the Geological Society, London," on "Calvert's supposed improvement in reducing gold ores," in your issue of the 14th inst., smack strongly of that objectionable quality, if not of personal animosity. Passing over the ill-natured observations with which the communication referred to is prefaced, and the contemptuous fling with which it concludes, with the simple statement, that, if I am not misinformed, Mr. Calvert is a member of the Academy of Scienees of Paris. The whole article proeeeds upon the false assumption, that the experiments were confined to the *artificial* mixture of gold and sand, whereas, Calvert states distinctly, that the operation was afterwards repeated on "*natural* auriferous quartz," and with equally satisfactory results.

The assumption by Mr. R., that any considerable quantity of gold remained in the ore or sand, is purely gratuitous, and is equivalent to saying that the professor did not know what he was about. "The proof of the pudding is in the eating thereof," and I opine that Dr. Calvert's assurauee that he succeeded, is enough to warrant a trial of his method, cheap and simple as it is, on some of our ores in this country.

Granting the existence of more or less sulphurets in any ore likely to be treated, even if roasted, I am doubtful of the correctness of Mr. R's ruling, as to the necessary formation of muriatie acid in the mixture of peroxyd of manganese, salt and *dilute* sulphuric acid. We all know that muriatic acid is made by treating salt with strong sulphuric aeid, say about 58° Beaumè, and heat; the resulting reaction being $Na\ Cl + SO^3,\ HO = Na\ O, SO^3 + H\ Cl$, in which water is decomposed, furnishing oxygen to the sodium, and hydrogen to the chlorine, formiug hydroehlorie acid, whieh passes over in the form of vapor; but it does not at all follow that *dilute* sulphuric acid has the same effect, especially in the presence of peroxyd of manganese, which of itself would decompose hydrochloric acid, aud whieh furnishes all the oxygen required, without the decomposition of water, thus: $Na\ Cl, Mn^2\ O^3 + 3\ (SO^3\ HO) = Na.O\ SO^3, 2(Mn\ O\ S\ O^3) + 3\ H\ O, Cl$. But, granting the formation of a small quantity of hydrochloric acid, owing to the decomposition of a little water by the liberated chlorine, it yet seems doubtful if, in the very dilute state in whieh it would exist, it would be able to effeet the formation of hydrosulphuric acid as assumed by Mr. R.; moreover the presence of a slight excess of peroxyd of manganese, over what was equivalent to the sulphuric acid in the mixture, would cause the decomposition of H Cl as fast as it was formed and in the case of a roasted ore, the oxyds of metals which would be sure to exist, would do the same. Finally, sulphuretted hydrogen and free chlorine could not exist, as their contact results in the formation of hydrochloric acid and the separation of sulphur.

Altogether, it seems as though Mr. R. would set up an objection purely theoretical, and based on a very superficial view of his subject, against the *facts* presented to us by Prof. Calvert, whose position and reputation entitle his statements to, at least, *attentive* consideration. In cases involving such various and complex possibilities, the only way to arrive at a satisfactory conclusion, is by experiment, repeated just so often as the conditions of the problem may be altered by a change in the ore operated on.

Inasmuch as Dr. C. speaks of saving "all the copper" as well as the gold, it would seem that he contemplates the use of roasted ores, or at least of such as contain that metal in some form other than a sulphuret, in which case it would, in the absence of iron, give employment to any hydrochloric aeid whieh might be formed. I do not imagine it was intended to apply the process to the working of silver ores; probably in speaking of silver he refers only to that which invariably accompanies gold, to a greater or less extent, as an alloy.

It must be remembered that the chlorination process, in whatever way effected, will not succeed with *coarse* gold, but it is well adapted to tailings, and I would suggest its application to the "auriferous slum" spoken of recently in the *Grass Valley Union*.

The very best way to settle the question of the applieability of Dr. C's proeess to any particular ore, is *to try it;* the experiment may be made on 100 lbs., in a wash tub, by any one possessing a little *gumption*.

And now Messrs. Editors, a word in your private ear. In a late letter of mine, you miscorrected the term *foot*-pounds, by substituting *feet*-pounds, and in my last, the term *humid* assay, is rendered *hurried* assay. C. A.

The woolen mills in Vermont are running with full force. Orders are large and the work is brisk.

Important to all Mine Holders.

The high importance of roasting silver ores for the purpose of extraeting the precious metals with a greater success than can be done by the so called raw-working, gives, has already, for more than a century back, claimed the attention of metallurgists and scientific men. In 1784, Von Born, in Vienna, introduced, with great success, the roasting of ores with salt. Since then many improvements have been made, but still presents some serious drawbacks, whieh have puzzled the brains of somo of our most scientific men to overcome. These obstacles are, first, the slowness of the process; second, the great expense attendant on the large amount of labor needed.

This expense (which in Washoe, for example, amounts to $20 a ton for roasting alone) added to the further expeuse of extraeting the silver, exceeds in many instances, the total value of the metal. Thus it is that so many eompanies, whose mines yield no richer metal than that of a $30 or $40 average, have been obliged to suspend work, despairing of ever realiziug any returns from their iuvestments.

The obstacles above meutioned appear to be removed at last. The writer of this has seen lately, at 416 Market street, a newly invented roasting furnace in operation, whieh invention reduees the expense of roasting to one half its former eost, whieh immense advantage will turn into a souree of profit what hitherto has been nearly valueless—we allude to what till now has generally been thrown away as rubbish, $30 to $40 ore—whieh amouuts to fully five-eighths of the produce of our Pacific silver mines.

The advantages this furnace possess are—First, one man is able to attend to six ovens; Second, it can be erected in less time and with less building material; Third, it takes much less fuel than other furnaces require; Fourth, it needs no stirring of the ore, having an apparatus inside to do this neeessary operation; Fifth, the ore is roasted more uniformly; and Sixth, it will roast quieker than in any other furnace. It can be taken to pieees and carried on mule-back, anywhere that a mule can travel; it oeeupies less space, requiring therefore less roofing than others, with many other advantages.

All thoso who understand the principle of roasting, would do well to convince themselves of the correctness of the above statemeuts by a personal inspection of this invention, which, in the writer's opinion, will create quite a revolution in the working of silver ores, brightening the prospects of many (at present) despairing mine holders.

J. Cogho,
Mining Engineer.

Remarks.—We have seen and examined the above deseribed apparatus for roasting sulphurets. The principle of its eonstruetion is a revolving cylinder, lined with fire-brick, and ribbed, upon its inside with converging serew threads, which operate to distribute the sulphurets, from end to end of the eylinder and assist in the diseharge of the same, when the roasting is completed, through an opening at a central point of the surface of the cylinder. This apparatus, to all appearances, possesses decided advantages over the ordinary reverberatory hearth for roasting.

We would saggest to all persons interested in the roasting of ores to call at No. 416 Market street, and examine this new apparatus for roasting, for which letters patent have been applied for through the agency connected with this office. Mr. Wm. Bruckner of this city, is the inventor. This apparatus will be illustrated in this paper, probably next week.

Wants to Dissolve.—The Citizen's Coal Mining Company of Mount Diablo District, filed an application on Saturday last in the County Court for a dissolution of their incorporation. Judge Cowles set the 24th of February for hearing the application.

Light in Egypt.—Seven thousand acres of land have been located by petroleum borers in Southern Illinois, commonly known as the Egyptian portion of that State, on account of its intellectual darkness.

[Written for the Mining and Scientific Press.]

From our Journeying Correspondent.

EDITORS PRESS:—Leaving Stockton on the six o'clock stage, we were enveloped for two or three hours in a dense fog, which shut out all view of the country, except for a few rods on each side of the road, though the slow rate of speed, and the loads which the coach-wheels carried with them, near enough to our eyes to be seen even in that fog, gave us an excellent opportunity for examining into the character of the soil. That we might be able more fully to realize its character, we were frequently invited to take a short walk, to lighten the load in the stage and supply ourselves with argillaceous specimens adhering to our boots.

For the first twelve miles, we walked at least half the time, and the distance was accomplished in five hours and a half, by the end of which time the passengers were prepared by waiting and exercise, to do ample justice to the excellent breakfast which the gentlemanly proprietor of the "Twelve Mile House" set before them.

During the remainder of the journey, the sky was clearer, and the invitations, "gentlemen take a little walk," were much less frequent, leaving us to imply that the soil was of a somewhat different character. We now made better time, and after a trip of ten hours, I found myself afloat in the streets of Knight's Ferry. Throughout the trip, its hardships were made lighter and its amusing scenes more enjoyable by the politeness of the driver, Mr. Sam Brown, and the road agent, Mr. Oliver, who are worthy representatives of the gentlemanly proprietors, Messrs. Dooly & Co., of Stockton. After a good dinner at Lane's Hotel, I began to look about for friends, one of which I found in Mr. W. Fisher, the Postmaster of the place who, when he found out my business, extended to me every assistance which could be given, and to whose politeness I was indebted for much of the pleasure and profit of my stay in Knight's Ferry.

This is one of the mining towns of the olden times, once the scene of much active business and many "big strikes," but which is now living and thriving in a quiet home-like way, with no fears of harder times than at present, and but little chance of ever being a great commercial city.

There is some placer mining around the "Ferry," to which the rains of this season have given a temporary activity, but no quartz mining of consequence. The most notable business feature of the place is the Stanislaus Flouring Mill, built and owned by Mr. D. W Tulloch, to whose politeness I was indebted for the privilege of making a thorough inspection of the mill and its contents. He went with me through every part and explained the working of the entire machinery. The building is of hard yellow sandstone, quarried from the bluffs, back of the town. The walls are three feet eight inches thick at the foundations, and two feet at the eaves, and the wood and iron works proportionally strong and solid, forming altogether the best structure of the kind I have seen in this part of the State. The power is supplied by two water-wheels, one a wheel of a peculiar kind, working on the same principle as the turbine, though differing in the manner of introducing the water, and the other, a patent central discharge wheel, which, however, he does not like so well as the first. There are two run of stones, capable of grinding from forty to fifty barrels of flour daily, besides a small run for cracking grain for feed. But the best part of all is, that my present worthy host says that this will make the best flour of any mill in this part of the country.

The country between Knight's Ferry and this place, shows many indications of being rich in copper, and the numerous "prospect shafts" seen all along the road, bear witness to the fact that the people once "believed in copper," but the fact that not one of those that I saw was in operation shows that their capital vanished, and furnishes a striking proof of the speculative character of the motives of many of those who start enterprises in this country. Not that I would accuse all who engage in prospecting for copper of speculative or improper intentions, but I know that many have commenced prospecting, with the hope of selling out at a profit to some one else, and without either the means or the inclination to develop their claims. The journey from Knight's Ferry to this place I made on foot, thus giving myself an opportunity for observation, which I could not have had if I had come by stage. On Friday night, I enjoyed the hospitality of Mr. H. M. Doyle, of Green Springs, who has brought to his farm life in California the peculiar virtues of his native state, Virginia. He has a fine garden and orchard which he supplies with water by means of a wind-mill and galvanized iron pumps, which raises the water into a reservoir built of stone and lined with water-lime cement, from which it is drawn by pipes to any part of the grounds where it may be needed. Taking leave of my generous host I proceeded by the same primitive mode of traveling to this place.

Chinese Camp has the appearance of a lively mining camp, and though I have not seen any extensive mining as yet, I am told that there is considerable placer mining, and several valuable quartz ledges in the vicinity, beside the copper mines of Montezuma, which are some two and a half miles above. But I hope to be able to tell more about the matter in a few days, when I have had opportunity to observe.

Chinese Camp, Jan. 21st, 1865. D.

[Written for the Mining and Scientific Press.]

Letter from Silver City.

EDS. PRESS:—Although the winter has not been a very severe one, we rejoice that it is so nearly passed, and the pleasant weather we now enjoy is a delicious foretaste and promise of the vernal equinox so soon to come. As the days lengthen the wakefulness and activity of people become more apparent—albeit there are but few drones in our community at any time. Dull as business has been, with "hard times knocking at the door," the spirit of energy and enterprize which characterize the pioneers of civilization has not been subdued. Along Gold Canon the hum of machinery knows no pause, while the continuous thumping of quartz batteries, bear witness that the brawny miner has not been idle. Indeed, men keenly in quest of fortune are not wont to be indolent, and the dwellers in our sage brush country, who rend from the igneous mountains their citadeled treasures, know well that in labor there is bread, and that abundantly.

In the Devil's Gate district, than which there is no more promising field for mining enterprise on the Pacific Coast, prospectors are almost daily rewarded by the discovery of ledges hitherto unknown. Extensions of known ledges are eagerly taken up, while from claims of established merit, such as the Daniel Webster, etc., ores of unrivalled richness are plentifully produced. A visit to this district, could not fail to be, to the man of leisure, a rare treat; to the capitalist, a secure and profitable investment. The one would find ample material for pleasant thought and healthy recreation at a very moderate expense. The other a district unequivocally rich in gold and silver, whose quartz ledges, bearing the precious metals, seam its entire extent, almost as closely and uniformly as the bars that stripe the field of our national flag. These are not meritricious terms designed to catch the ear, but words of truth and soberness.

It may be wondered at, that a district so productive, whose rugged countenance seems to anticipate the desires of the honest miner, should not long since have become celebrated; but for this it is easy to supply sufficient reason. In the first place, that great and worthy celebrity, the Comstock lode, monopolized at once, *pro rata*, an undue share of the adventurer's attention and capital. In its giant presence ledges of unwonted dimensions appear dwarfed and barren, whilst in reality it is not comparatively more valuable than they. Again, a still more fatal hindrance to the prosperity of this district, may be found in the futile management, the execrable and absolutely ridiculous engineering of such companies as did, two years ago, make a weak effort at existence. There are workings here that would be a standing disgrace to the ingenuity of a Digger Indian, and those on the property of companies that once shone well on paper. Maudlin tunnels that reel to and fro, stumbling upon the object of their search only to shoot off at a tangent into the ground. In the majority of cases, if the honest miner had been left to himself such abortive operation had not been. But illiterate charlatans who vainly attempt to compensate for their lack of brains by the possession of a fifty cent compass, and the arrogant assumption of a knowledge they neither possess, nor are capable of possessing, come upon the ground, and if their chances be one, to make, they are ten thousand, to mar. I forbear to cite instances of the folly and madness of submitting any mining enterprise to the care of such engineers, lest the ghosts of ruined shareholders should reproach me for disturbing their repose.

It would however, be most unfair and unjust to permit the impression, that all our mining operations are thus conducted, for we have some few companies whose management is all that could be desired, and these have borne the brunt of the hard times, and the popular loss of faith in such investments, successfully and well. Ranking the mines at present in operation, relatively to their extent and value, we have first the Daniel Webster, upon which the labor has been continuous from its inception. They are taking out highly auriferous rock. The quartzose vein is, in its center, a mass of brown sulphates, which diminishing towards the sides of the lode, leaves the quartz walls fairly beaded with free gold Judging from the adopted theory of the formation of mineral veins, and with which results obtained in this section so fully coincide, it is highly probable that this mine will ere long be paying dividends instead of levying assessments. They are now crushing, and will have about twenty tons more ready in a few days. [We give the language of our correspondent, as written, although it is manifest that a continuous vein of the character described, would be a mineralogical marvel. The indications above referred to must be confined to a pocket, or the vein ought to pay larger dividends than were ever realized from the Gould and Curry.—EDS. PRESS.]

The "Cook & Gray" claim, worked as it is with pains-taking industry, continues to reward its owners with very productive ore. The Kennebec, a new company formed within the last month, are taking out ore worth $90 to $100 per ton. The "Bogoda," also a new company, have got a remarkably rich ledge, and are already realizing a profit on their investment. The "Georgiana," a Spanish claim, is in a like condition. I believe they are at least crushing ore of good value, and which is obtained at but little expense. The "Sebastopol" is worked on private account and is paying handsomely. Indeed, the great majority of claims in this district, upon which work has been suspended, would pay and pay well if worked under a judicious management. To have them thus worked, they must be under the care of resident managers, men of probity and intelligence. An integrity, that commands public confidence is the primary element of of success in business. The fabrication of "wild cat" stock has so damaged the mining interest that a recognized and unimpeachable honesty is now more requisite than ever. When the bejewelled fop who drives his pair and keeps his courtesan, at the expense of shareholders, is replaced by the man of unassuming virtue and truth, our mining interest will prosper, and *not till then.*

FINEO.

Silver City, Nevada, Jan. 21, 1865.

WINE AND WOOL.—Ohio produced the most wool of any State in the Union in 1863. Her "clip" being nearly 11,000,000 lbs. California takes the lead in wine, having produced during the year about 1,000,000 gallons.

THE San Francisco Art Union is now open daily. The exhibition reflects great credit on the Society, and develops, in a measure the number of art treasures we have on the Pacific Coast.

Report of the Rose Gold Mining Company.

To the Stockholders:—The Trustees would respectfully submit the following report of their stewardship for the year just closed:

The claim of the company is situated in Gentry's Gulch, on the side of a mountain, some 1,500 feet, westerly about one and a half miles from the north fork of the Merced river, in Mariposa county. The company's title was derived by purchase, from the original locators; and, to further secure a more perfect title (as some deeds had not been recorded), the claim was re-located, in accordance with the laws of Coulterville district, for the company.

For the purpose of thoroughly prospecting the lode before going to a heavy outlay in opening the claim, four shafts were sunk, their depth being respectively 32, 40, 65 and 93 feet. In each of these shafts the vein was found to be rich in gold and well defined from the surface down, and the ledge has increased from a few inches to over two feet in width. Most of this prospecting was paid for by the yield of the mine, no crushing having yielded less than $80 per ton.

The precipitousness of the mountain is such that it was found that the erection of a whim and the deeper sinking of a shaft would necessitate an outlay somewhat larger than the running of a tunnel to strike the vein; hence all work on the shafts was abandoned, and work commenced on a tunnel, which is now in some thirty feet. At a distance of about seventy feet it will cut a vein of quartz, which is supposed to be a spur of the Rose lode. Thirty or forty feet further it will cut the Rose vein, and will then be driven 200 or 250 feet on the lode, to the main shaft. It will cut the vein 150 feet below the bottom of the main shaft, or about 240 feet from the surface. Mr. Philip Hope, a miner of experience, and a resident of Mariposa county, has offered to complete this tunnel at $6 per foot, and articles to that effect are now being entered into between him and the company.

For the purpose of commencing this tunnel, and to pay off a small balance due for labor on the shafts, an assessment of fifty cents per share was levied in September. An assessment of twenty cents per share was levied in December, and is now due. All stockholders, and particularly those who have seen the mine, have great faith in its value, and for this reason the company has never been hampered by any shares upon which assessments have remained unpaid. Each and every shareholder has paid his assessments in full, and there is no dead stock on the company's hands. By order of the Board of Trustees.

J. C. CHAMPLIN, President.
A. BUETELL, Secretary.

San Francisco, January 3, 1865.

CARING FOR THE HEROES.—The New York Chamber of Commerce has undertaken to raise $100,000 for Admiral Farragut, as a testimonial of their appreciation of his public services. It is only in this way that our heroic officers can be rewarded. The American Government cannot reward its heroic defenders as do the Governments of Europe; but the *people* can, and ought to. For less distinguished services than Farragut has rendered, Nelson was lorded and enriched by England, and for less than the military merit displayed by either Grant or Sherman, Wellington was made the first man of his age, and had estates voted him that brought a princely annuity for life.

LASSOING A FISH.—We clip the latest fish story from the Alameda *Gazette*, according to which paper a Mr. Cleveland, of that place, a few days since, noticed a sturgeon very busy with his head on the bottom, perhaps digging for clams, while his tail projected just above the surface of the water. Having a lasso at hand, it was so promptly and dextrously thrown over Mr. Sturgeon's tail that he was finely corralled and drawn to the shore. He measured over nine feet in length and three and a-quarter in girth, and weighed 250 pounds. Alameda is ahead on fish.

AN ODD FELLOWS' JOURNAL.—We omitted to notice last week the appearance of the *New Age*, a handsomely printed quarto journal, devoted to Odd Fellowship, the arts and sciences. It is published by W. W. Brough ton, and is to appear weekly. Much judgment and talent is displayed in the editorial department, and the paper is well deserving the support of the Order and the public generally.

BUTLER'S CANAL, which has been so long in progress and was recently opened, goes through a strata of unctious clay in which vegetable matter exists, and which is used for fuel.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, JAN. 28, 1865.

Little or no change is perceptible in the condition of the money market, save that a further accumulation of capital may be noted, together with occasional concessions in the rates of interest to certain borrowers. Money is thought to be more plentiful than for some time past, and is likely to remain so for the present. Receipts of bullion from the interior and Northern coast since Saturday last exceeded one million dollars, $350,000 of which came from Washoe. Gold bars have been in good demand recently, and are worth about 850. Silver bars are selling at 1@2 ℔ cent. premium for selected parcels.

The share market has exhibited a fair degree of activity this week, the aggregate transactions being larger than usual. First-class stocks have been well maintained, and met with ready buyers at current quotations. Shares of less intrinsic value have been subjected to characteristic fluctuations, and afforded considerable business to speculative dealers.

City stocks have been very quiet, and few or no transactions were recorded.

Legal Tender Notes have been very actively dealt in, and large sales took place, opening at 49¾, receding to 48½, seller 30, rallying to 50½, declining to 48 at 30 days, and closing at about 48. Latest telegraphic advices from the East quote gold at 208.

Firemens' Fund Insurance Co. is in demand at 110. This company have accumulated a surplus fund of some $55,000, in addition to their capital stock of $200,000. Pacific Insurance Co. has advanced to $127 bid, $137 asked. Spring Valley Water Co. is in favor at 80 ℔ cent. on amount paid in. On the 9th of February the San Francisco Water Co. will be merged into this Company, and the stock of the Spring Valley Water Co. will be increased to 6,000 shares, of $100 each, in lieu of the plan originally proposed.

Savage continues to be steadily maintained, and has fluctuated but little, advancing from $1,600 to $1,630, and closing at about $1,620 bid, at which rates 13 feet were sold. No material change has taken place recently in the character or quantity of the ore taken from this mine, and the receipts of bullion are fully up to the average of the past few months.

Gould & Curry is in better request, and 23 feet changed hands, advancing from $1,495 to $1,535, and selling yesterday at $1,515. We can learn of no new feature in this mine. Operations seem to be progressing satisfactorily, and arraugements will soon be perfected for a more thorough development of every portion of the claim; meanwhile the company's receipts of bullion will enable them to prosecute this work, and also to declare the regular dividends to stockholders.

Chollar has been very actively dealt in, and 55 feet were sold, receding from $1,025 to $990, rallying to $1,000, and closing at $1,005. The yield of this mine, so far, the current month, has amounted to about $150,000, and some 160 tons of good ore are now daily sent to the different mills. The drift from the main shaft, to communicate with the fifth level of the south mine, will, it is thought, soon reach the lode at that point.

Belcher is attracting more attention, and has advanced to $975 bid, cash. This company are now hoisting some 75 tons of ore per day, which yields them about $50 per ton net. The present working level is at a depth of 300 feet, but it is proposed to sink 100 feet deeper. The net receipts of bullion have so much increased recently, that a dividend of $48 per foot is talked of for the month of January.

Yellow Jacket has been more active than usual, and 41 feet were sold, opening at $880, advancing to $975, buyer 20, declining to $855, rallying to $920, buyer 30, and selling yesterday at $910. The Supreme Court of Nevada has consented to hear a motion of the Union *vs.* Yellow Jacket, and the argument for a new trial will be heard in about ten days. Recent developments in the Yellow Jacket are said to be of a very favorable character, and large deposits of fine ore have been disclosed. This claim bids fair to take rank with the best mines upon the Comstock.

Potosi has met with trifling sales at $725 per foot. Active operations have been resumed and within the past ten days some 2,500 tons of ore have been sent to various mills for reduction.

Crown Point is inactive at $700 bid, $750 asked. The company have now the entire control of the water in this claim and are hoisting some good ore from the lower drift, at a depth of 250 feet. The east vein contains five feet (in width) of rich ore, and it is believed that several additional mills can soon be employed.

Empire Mill & Mining Company remains inactive at quotations. The receipts of bullion for the month from this mine are well up to the usual average and promise the usual monthly dividend. The company work only their own mills, for which their supply of ore in sight is believed to be abundant for a long time to come.

Ophir has been in better favor this week and 33 feet were sold, advancing from $300 to $330, receding to $315, again rising to $330 and closing at $320 bid, $330 asked.

The water in the Central shaft is still over 100 feet deep, but being below the seventh level, does not interfere with the working of the Ophir mine, from which they are taking out about fifty tons daily of third class ore and some first class ore, the latter paying over $800 to the ton. The liberal receipts of bullion for the month of January would seem to promise an early resumption of dividends, if prudence did not require the retention of a considerable surplus to meet expenses attending the extensive works projected, and under way, in connection with the Mexican mine.

Uncle Sam rose from $230 to $265, fell to $220, and closes at $275 bid, $280 asked. Within this range 120 shares have been sold. Hale & Norcross fell from $205 to $175, rallied to $235, and closed at $190. The incline (outside the vein), to reach the lode at 150 feet, greater depth, is now fairly under way.

Imperial fell from $131, buyer 30, to $112, rallied to $118, and was sold yesterday at $117. The company have accumulated a surplus of some $25,000.

Sierra Nevada revived this week, and 1057 shares were sold, advancing from $22½ to $40, buyer 30, and closing at $27½. It is said, that at a depth of 417 feet, a pay vein some 10 feet in width has been found, containing ore averaging about $50 per ton.

Bullion has been regarded with rather more favor this week, and 720 shares changed hands, advancing from $73 to $90, buyer 30, dropping to $79 and selling yesterday at $81.

Burning Moscow continues active at less variable rates and 3,133 shares were sold within a range of $23@$28, closing at about $27½.

The aggregate sales of Stocks and Legal Tender Notes since Saturday last amounted to $526,074.25

Commissions on Mining Shares.

Sale at 1 dollar up to 10 dollars	$0 25 per foot
Sale at 10 dollars up to 25 dollars	50 per foot
Sale at 25 dollars up to 50 dollars	1 00 per foot
Sale at 50 dollars up to 100 dollars	1 50 per foot
Sale at 100 dollars up to 200 dollars	2 50 per foot
Sale at 200 dollars up to 400 dollars	5 00 per foot
Sale at 400 dollars up to 600 dollars	6 00 per foot
Sale at 600 dollars up to 800 dollars	7 50 per foot

From $800 to $3,000 per foot, one per cent. on the amount of purchase or sale.

Anything above $3,000 per foot, three-quarters of one per cent. on the amount of purchase or sale.

FRANK LAWTON, Secretary.

J. B. E. CAVALLIER President.

Mechanical.

PATENTS ALLOWED.

The following patents, for which applications were made through the Mining and Scientific Press Agency, have recently been allowed:

Zenas Wheeler, of this city: a new Concentrator.

Zenas Wheeler, of this city: a new Amalgamator.

Austin Z. Page, of Weaverville, Cal.: a Device for Raising Sunken Vessels.

J. H. H. Wilbams, of Oakland, Cal.: assignee to himself and S. T. Parr: a Window Sash Suspender.

John. Dolbeer, of this city: a Calculating Machine.

John Searle, of this city: for a Process for Importing Air to Mines.

William Brückner, of this city: a Process for Refining Amalgam.

Franklin P. Peregoy, of Taylorsville, Cal.: a Union Gnide and Journal Box.

George K. Peterson, of this city: a Quartz Crusher and Pulverizer.

Boring Rocks with Diamonds.—A tool was patented at Washington, about a year ago, and noticed by us at the time, for boring rocks with a cutting edge made of diamonds. The invention was generally considered an impracticable idea, and little was said or probably thought about it by any person except the inventor. The American *Artizan*, however, now informs us that the tool has been put to actual and successful practice in boring for oil wells in Pennsylvania. It consists of a tubular stock of steel, having attached to it cutters composed of diamonds. It makes an annular cut, leaving a solid cone of rock in the centre of the cut. The editor of the *Artizan* has seen a cone three and a half inches in diameter, taken from a four and a half inch bore, through some of the hardest rock at Oil Creek, Pa.

Eighteen inches are said to have been bored through this rock in twenty minutes, when an ordinary drill would not have cut two inches in twenty-four hours! It is said that a well which ordinarily requires six months to sink, may he bored with this tool in one week.

A further important advantage which may he derived from this drill is that it will hore out broken drills. Many wells when nearly completed have been necessarily abandoned from the breaking of the tool in such a manner as to defy the ordinary means of extraction.

We are without any information with regard to the cost and wear of the tool in the operation; the paper from which we derive these facts, merely informing us that, "the diamonds of which the cutting edges are formed are of an inferior quality to those used in jewelry."

A Portable Steam Engine for the Mines.—A fine portable Steam Engine was recently sent from this city, into Tuolumne County. It is designed to be used as the motive power for driving the amalgamators at the quartz-crushing mills which Dr. Ryerson is now constructing. The engine is placed on wheels, so that when necessity requires it can be moved to any point accessable by a heavy wagon. We have often wondered that these machines have not been more generally used for prospecting purposes in the mines—for driving pumps and light machinery to more thoroughly test a vein before erecting expensive machinery upon it. One of these machines and a small portable battery could he placed in position for working at a trifling expense, and when not wanted any longer, its location might be changed almost as easily as that of a loaded four horse wagon.

Home Made Locomotives.—Donohue and Booth of San Francisco have contracted to build ten first class locomotives for the San Jose Railroad Company at a cost of $17,500 each.—*Interior Exchanges.*

Ten first class locomotives would be rather a heavy order to be given at one time, by a railroad only forty miles long. If our interior exchanges will write *two* instead of *ten*, the above item will be correct.

Turpentine.—Jacobson & Co., of Oroville, shipped on the 20th instant, to San Francisco 5,400 gallons of California spirits of turpentine.

Written for the Mining and Scientific Press.

How to Calculate the Power of an Overshot Water Wheel.

Editors Press:—In an answer to a question as to the power of a water wheel of twenty-four feet diameter, using sixty inches of water, miners' measure, Mr. Chilaud is informed, in your last issue, that he could expect four-horse power from the wheel, basing his calculation upon an erroneous estimate of the quantity of water discharged by sixty inches, miners' measure.

Now, Mr. Chilaud can, according to the best authority in such matters, expect only three-horse power, though the wheel could perform as much work as a steam engine, bought perhaps as a four or five-horse power machine. Sixty inches, miners' measure, discharges ninety cubic feet of water per minute, weighing 5,625 pounds, which weight falling through twenty four feet in a minute, on the wheel, gives a mechanical effect of 135,000 feet pounds, or four-horse power theoretically. But the friction of the gudgeons and the spilling of water from the buckets, before arriving at the lowest point of the wheel, cause a loss of about twenty-five per cent. of power in a well-constructed wheel, which reduces the effectual force to a three-horse power.

The clearance of three inches between penstock and wheel is by no means sufficient to lay the water on the wheel with the necessary velocity, from the following considerations:

A velocity at the circumference of from six to ten feet per second, for wheels from twenty to forty feet diameter, has been found to answer best. If the velocity of the periphery of the wheel is too great, the friction of the gudgeons and early spilling of water in consequence of its being forced up the arms of the buckets by centrifugal force, take off considerable power; if the velocity of the periphery of the wheel is too small, the weight of the wheel and consequently the friction increases, as the buckets have to hold more water.

Assuming, therefore, a velocity of six feet at the periphery for a twenty-four feet wheel, which is equivalent to five revolutions per minute, as a good one, and regulating the pulleys accordingly, we have to deliver the water upon the wheel from the penstock, at least with the velocity of the periphery of the wheel. But it is better to lay the water on the wheel with double the velocity of its periphery. In order to do this *we require a fall of two and a half feet* from the penstock to the wheel. If this additional fall cannot be spared, it is advisable to reduce the diameter of wheel. The width of your wheel, calculating on a depth of crown of one foot, ought to be twelve inches, and the number of buckets fifty-four.

In conclusion, I would call the attention of your readers to the fact that according to the notion of engineers, the man who carries ten bricks, through a certain distance, for a certain number of trips, will do *considerably more work* than the one carrying twenty bricks through the same distance, for half that number of trips, as the first has to carry his own weight through double the distance traveled by the second; or does a man produce no mechanical effect by walking a certain distance without any other load than his own weight?

Delta.

Indestructible Coal Oil Lamp Wicks.—George E. Smith and C. F. Colton, of this place, have invented a new, convenient and indestructible lamp wick, which is superior to those now in use; first, that it never requires trimming; second, it never consumes the wick, and being always made true at the end where the flame is, more light can be had from it than any other lamp wick; and fourth, if made well in the beginning they never smoke or break the chimnies like badly trimmed lamps. They have filed their caveat for a patent. For the past week, we have been using two of these wicks, and find them greatly superior to the old wicks in all the points above stated. With this improvement, the labor of cleaning the chimnies and repairing the lamps is comparatively small—you might say, keep the lamps well filled with oil and you have more light without farther trouble.—*Oroville Record.*

There are about one hundred mining companies organized in New York, Boston and Philadelphia, to work mines in Colorado Territory.

Can a Gas-holder Explode from External Fire?—A late number of Newton's *London Journal* devotes what would occupy nearly a page in this paper in attempting to prove that there cannot be any expectation of serious danger of "explosion from a gas-holder when in the midst of a great conflagration; not even when the heat is so great as to raise the holder itself to a red heat." The article in question was called forth by a great "scare" which recently occurred at a large conflagration in London, when the approach of the devouring element was stayed only on its near approach to one of the largest gasholders of that metropolis. Considerable excitement and alarm was the consequence, and several newspaper writers subsequently held that had the fire enveloped the gasholder, an explosion would have occurred, such as might have seriously damaged the city for several blocks around—perhaps have toppled over the dome of St. Paul's. The article in question was written to allay that excitement, and is very full and specific, and appeals for confirmation to the supposed fact that such an explosion never did occur.

We have never, in our reading, heard of a gasometer becoming enveloped in an extensive conflagration, but once—and that occurred in the city of Novada, in this State; and, notwithstanding the column essay of the writer in the *London Journal* that a gasholder cannot explode, the Nevada holder *did explode!* As extensive gasholders are now quite common institutions in the midst of populous neighborhoods exposed to conflagrations, it might be a matter of interest to ascertain the particulars of the Nevada explosion, so that we may judge how much danger, if any, may be apprehended from such a source. Will one of our Nevada contemporaries enlighten the public on this matter?

Mining and Scientific Press Patent Agency.

SAN FRANCISCO.

Information About Obtaining Patents.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor:—*Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the Mining and Scientific Press. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of construeting models, drawing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attend upon the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analagous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or unconnnon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will ofttimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only upon the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: Dewey & Co., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instructions, etc. Our charge for preparing the case is then all that will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but on other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented: likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the munificent fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos	$10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On every caveat	10
On every application for a patent	15
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on re-issue	30
On every application for an extension	50
On the grant of every extension	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the U. S. Court, of the District of Columbia. These appeals are heard by any of the Judges before whom the applicant elects to bring the case. No Jury. All the papers, models, etc., are sent by the Commissioner to the Judge, who then reviews the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty-five dollars. The Judge appoints a day of hearing. The applicant is required to file an appeal reason, and state his case and file a written argument. Five days are allowed the opponent to put in an answer, and a similar period to the appellant for a closing reply.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

It is Impossible for editors to know all the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions or machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:
Saturday Morning, Jan. 28, 1865.

Canvassing Agents.

We would call attention to the following named agents of the MINING AND SCIENTIFIC PRESS as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the Press, will be acknowledged as a personal favor to us:—

Wm. R. Bradshaw—San Joaquin, Calaveras, Merced, Tuolumne, Stanislaus and Mariposa counties.

Mr. Robert Lattimore—Butte and Yuba counties.

A NATIONAL MINING BUREAU.

Our vigilant mining representative has introduced a bill into the House of Representatives, which has for its object the creation of a Mining Department in the Government, connected with the Department of the Interior, whose object shall be the collection and diffusion of useful information on the subject of mining. It is designed that the Bureau shall be placed under the direction of a Commissioner, resident at Washington, with a salary of $3,000. It also provides for a chief clerk, who must be skilled in mineralogy, etc., and not more than three other clerks as assistants. The bill also contemplates the employment, by the Commissioner, of an agent [agents?] to report upon the extent of the mineral resources of any State or Territory where minerals may exist.

The bill, as published, speaks of "an agent," we suppose, however, it is the evident intent to appoint local "agents," in such localities "States and Territories" as the Commissioner may deem advisable to collect "useful information" "concerning mines, metals and mining operations, and for making records for mineral deposits, etc." Also, "to gather information concerning the various methods of opening mines, excavating and extracting ores, ventilating mines and freeing them from water, and for crushing and reducing ores, and for all other business relating to mines and mining."

We presume the idea involved is a management, similar to that of the Agricultural Department, where the information collected is of a general and practical nature, and spread before the public in a popularized form, so that it may be made directly available by the working miner, as the agricultural reports are fitted to the understanding of the working farmer, of ordinary education. More full and scientific reports and observations, would properly come under the head of geological or other purely scientific surveys, calculated to reach and benefit the miner only indirectly. This work is already under way in this State, and has been committed to able and competent hands.

The benefits of the Agricultural Bureau are already felt and fully acknowledged. A similar Bureau established for the benefit of the mining interest, if properly managed, could not fail to be of equal or more service to the country. The development of the immense mineral wealth of that great region stretching from the summit of the Rocky Mountains westwardly to the Pacific Ocean, and north and south through almost the entire extent of our Pacific Territory, to say nothing of that which exists eastwardly, is certainly such as to warrant some care and attention from government. A little fostering, in the right direction, cannot be misapplied. Mr. Cole is doing a good work in this effort, and and we trust he will succeed. The bill was laid over temporarily; but subsequently, on the 19th of December was read twice, referred to the committee on Public Lands, and ordered printed. The object of the bill is favorably referred to in the report of the Secretary of the Interior.

TO MINERS AND MECHANICS.

The publishers of this paper are making great efforts to establish, for the benefit of miners and mechanics, a journal which shall occupy an the Pacific coast a similar position to that filled by the *Scientific American* and the *American Artisan* in the Atlantic States. Our isolated position and peculiar necessities appear to require a journal quite distinct, in many particulars, from similar publications at the East. To meet this want we have established the MINING AND SCIENTIFIC PRESS. Here the miner, the mechanic, and the man of science, find themselves brought in closer contact and more dependant, each upon the other, than in any other locality on the globe. Hence we have endeavored to present this paper to this community of interest as a representative journal. In order to carry out the plan of our work as it should be done, we greatly need the assistance and co-operation of those for whose benefit it has been established. Every miner, every mechanic and many men of science to whose attention this paper is submitted, or who may, as a regular subscriber or by casual circumstance, hold this paper in his hand, should show it to his friends—the miner to his fellow-miners and the mechanic to his fellow-mechanics—and do what he can to induce them to join him in the support of a journal whose measure of usefulness will be in proportion to the liberality with which it is supported. The press, throughout the State, and the public everywhere, so far as we are informed, recognizes the value and importance of the MINING AND SCIENTIFIC PRESS to the great interests in California, to whose advancement it is pledged. It has now reached its tenth volume, and is established on a firm basis. Its publishers are desirous of still further improving its appearance and usefulness. Hence this appeal to its friends. The paper has just entered upon a new volume and the present affords a most favorable opportunity to commence your subscription. Numbers have already come in, since the commencement of the new volume, and we hope to add many more to our list ere we reach the close of another quarter. No better investment of money can possibly be made by the miner or the mechanic. The information contained in one volume of this paper is of many times more value than the cost of subscription—and worth far more than the information which the same amount of money will purchase in books.

JULIUS REDIVIVUS.—We have received a number of a scientific paper, "fearfully scientific," as one of Squibob's rounds with Judge Ames was—called the *Pacific Index*, and published by Julius Silversmith, formerly of the San Francisco * * * * The *Index* is being run in New York City. After many years' acquaintance with you, Julius, and a careful studying of your points, we have come to the conclusion that "you won't do."

We clip the above "first rate notice" from the Grass Valley *National*. Following, also, is another—a regular double-header:

A LOVELY PUFF OF A NOTABLE CHARACTER.—Most of our readers will recognize the wit and truth of the following left-handed puff of a former resident of this city, copied from the Nevada *Transcript:*

NEW PAPER.—We have received the first number of a new paper called *The Pacific Index*, published by Julius Silversmith, late editor of * * * * * *, San Francisco, Commissioner for California and Nevada, author of Metallic and Agricultural Wealth, owes an advertising bill at the Nevada *Daily Transcript* office, author of Miners' Companion and Guide, wormed a letter out of Governor Nye addressed to President Lincoln, and in fact the biggest "hilk" that ever visited the Pacific coast.

This Court concurs.—*American Flag.*

Evidently the editors of the above journals are "intimately acquainted with their subject."

Auriferous Sulphurets.

MESSRS. EDITORS:—I wish to ask for some information on a subject in which all quartz miners, and in fact every one, should take a deep interest. I refer to the extraction of gold from auriferous sulphurets. This county and Siskiyou are known to contain very rich sulphurets, principally gold, and all that is wanting to add many thousands of dollars to the yield of Northern California, is some cheap and feasible plan for the reduction of this character of ores. What is known as the chlorination process, seems to be the only one now discussed through the papers—some declaring it impracticable, dangerous to life and health, involving great expense and not at all adapted to a new country; but you mention in your journal that certain works have been closed, where this process has been carried on successfully. If successful in one or two cases why not in many? For any information you can give us on this or any other plan we will be much obliged. W. W.

French Gulch, Shasta Co., Dec. 17th, '65.

REMARKS.—The first great necessity for obtaining the precious metal from auriferous sulphurets, is to concentrate them from the mass of sand which comes from the batteries. The gold bearing quartz veins of this State usually yield from five to fifteen per cent. of clean sulphurets. The expensive process of treating them will not admit of their being worked in the mass—they must be first "concentrated" or separated from the sand. The sand, as it usually comes from the batteries, if properly treated will be reduced to about one-fifth or one-sixth its bulk and weight. In that condition it must be roasted, and subsequently submitted to either a chemical or ordinary amalgamating process in a pan.

The great difficulty heretofore has been the lack of a proper class of machinery for "concentrating" and "roasting." We feel quite fully assured, however, that both these difficulties have now been pretty effectually overcome. Both Mr. Hunter and Mr. Prater are now advertising in this paper, concentrating machines, recently invented by them, which have been fully proven by actual use. The cost of concentration is a mere trifle. The machines can be purchased for from $250 to $300, all ready to set up.

The process of roasting is a more expensive one, especially, as it has been heretofore performed, in reverberatory furnaces. Various attempts have been made to simplify and cheapen this process; but we have seen nothing which appears more promising than the one noticed in our columns this week, as the invention of Mr. Bruckner, of this city. We would refer our correspondent to that notice. The furnace can be put up for a mere trifle in comparison to the cost of furnaces heretofore employed. Its cost is within the reach of every mill owner in the State.

With reference to the chlorination process, the surmises of our correspondent with regard to the unhealthiness of the same are correct. It is undoubtedly the most perfect process known, and is not particularly expensive. The closing of the Works on the San Bruno road was not caused by difficulty in the process or its expensive nature; similar works will soon be started in another portion of the city, by the same party who established those of the San Bruno road.

Much has been recently said with regard to the Calvert process. It does not appear to be fully understood—perhaps it is not duly appreciated. We refer to the communication from "C. A." upon the process in the present issue of the PRESS, and to several previous articles. A full description of the process will be found in the MINING AND SCIENTIFIC PRESS of December 17th, 1864.

A PATRIOTIC SOLDIERY.—The soldiers of the Federal army in the field have, during the past year only, loaned to the government from their earnings not less than $20,000,000. Such a fact is without parallel in the history of the world. This end has been reached by the amount of seven-thirty notes being taken, as part payment, instead of requiring the full amount in greenbacks.

WELLS FARGO & Co. have 152 local agencies on the Pacific Coast, outside of San Francisco.

SWINDLING MINING SCHEMES AT THE EAST.

One would think, from the frequent announcements in the eastern journals, particularly those published in New York, of the splendid mining schemes founded upon localities on the Pacific slope, of asserted extraordinary richness, that our Atlantic cousins were "gobbling up" all the choice spots throughout our extended mineral regions. Scarcely a steamer arrives, that does not bring us word of some stupendous mining scheme, which has been put in the New York market, that is bound to make every considerable share-taker therein a millionaire. And, strange to say, not one in ten of these extraordinary rich locations have ever been heard of in San Francisco, until we read of them in our eastern exchanges. Time and time again have these swindling schemes been ventilated by the California press, but, "still they come." Scores of letters are also being received by every mail, by persons in California, from their friends at the East who have put their money in these ventures, in good faith. Many of them never had even the vestige of an existence, except on paper; others are mere swindling schemes got up to sell for large sums, worthless mining locations, which would not bring enough here to pay for printing the stock books of the company.

The latest scheme of this description was brought to our notice by exchanges received by the last steamer, and is based upon alleged extraordinary discoveries of Petroleum "near the coast of California, about 320 miles south from San Francisco," where it asserted that a Mr. Gilbert "has put up for himself a refinery," and drawn "from *one* of the great oil wells, 400 barrels without apparently diminishing the supply." Californians, who know that there never has been even *four* barrels of oil refined in this entire State, will read the above with surprise, which will in nowise be abated when they read the following extract from Professor Silliman's report of the locality, which accompanies the account. The Professor says:

"The property covers an area of 18,000 acres in one body, on which are at present at least *twenty natural oil wells*, some of them of the *largest size*, (!) * * * Artesian wells will be fruitful along a double line of, say *thirteen miles*, and, at least *twenty miles* in linear extent." (!!!)

Before leaving California, the professor stated to a friend of his, in this city, that he had realized over $200,000 in gold, from his professional services, during his stay here. We have learned from other parties who have availed themselves of his services, that he informed them he regulated his terms in accordance with the favorable or unfavorable nature of his reports. If that was his rule we should judge the report made to this company ought to have realized for him a large item in his two hundred thousand dollar fortune. If we are misinformed, or exhibit an inexcusable ignorance with regard to the above, and similar schemes we are but suffering a lack of knowledge which is quite common among intelligent mining men on this coast.

NO OIL WELLS IN GREAT BRITAIN.—Oil wells are not found in Great Britain, and in order to render themselves independent of this country in this now indispensable article of merchandize, some of the English inventors are busying themselves in producing machinery for the economical extraction of the oil from coal. A coal district in Flintshire, bids fair to become famous for this business. Large quantities of coal have for years been raised in that district for the manufacture of gas. Recent discoveries have proven that several of the seams found there are capable of being used with considerable profit in the manufacture of mineral oil, and a Mr. Fernil, having recently made a successful experiment in this direction, has been followed by quite an army of oil makers. There is not much danger, however of English oil stills, assuming a very successful opposition to American oil wells.

WEEKLY AGGREGATE.—The Virginia *Union* of the 8th, says that during the week ending on that day, over five tons of bullion were shipped from that city, worth $256,714 76.

Mining Summary.

REESE RIVER.

The Virginia papers still continue to report the arrival at that place of considerable amounts of bullion from Reese River, and Eastern capitalists appear to hold the mines of that region in high favor. Agents from New York are almost constantly there for the purpose of investing in those mines. A late number of the *Reveille* states that Mr. Morean, of Cincinnati, was in Austin, authorized to invest to the extent of *two millions* of dollars in the Reese River Mines. Dr. A. L. Mosely, also of New York, was there at the same time, on a visit of inspection of the mines. The developments of that region have heretofore been confined chiefly to the immediate neighborhood of Austin, but, according to the *Reveille*, the entire section of country to the East of that place to the State line and bordering on the Overland road, bids fair to equal in mineral wealth the most noted and favorite sections. The Eureka, Forest, Diamond, Yreka, and Egan Cañon Districts, are all near the great Overland road and in the different ranges of mountains to the eastward. These districts have all been prospected sufficient at least to prove that some fine ledges exist in them. At Egan Cañon, a short distance beyond Ruby Valley, there is now a mill in successful operation, that has already turned out a large amount of bullion, proving beyond a doubt the great richness of the veins operated on. Messrs. Fuller & Co. are now erecting another mill, which indicates that the cañon will soon be a mining section of much importance.

Diamond District, lying some ten miles west of Ruby Valley, is proven to contain a number of lodes of great value. Some very fine rock had been taken from the Silver Wreath, a new location by Mr. Grey, the Recorder of the district. The vein is said to be two feet thick, and it is thought will yield near $200 to the ton by mill process. Arrangements have been made for the erection of a mill in connection with some of the lodes of Diamond District as soon as spring opens, which it is expected will add another to the already extended list of rich localities, that in a few months will contribute its portion to the silver stream that will flow westward from that region.

The famous Amador, which was somewhat disturbed and broken near the surface, is said to be improving in depth, both in regularity and richness. It is now thought to be pretty thoroughly developed, and the opinion is expressed that the proprietors would be fully justified in fitting up steam hoisting works and a mill.

Work has been energetically resumed upon the Tesoro and James River Consolidated Gold and Silver Mining Company, under the supervision of Mr. Geo. T. Terry.

The suit between the Isabella Mining Company and the Wall Gold and Silver Mining Company is progressing slowly before Judge Beatty, and attracting considerable attention. Both parties are ably represented.

DARRA LODE.—The Darra lode, situated on the hill between Pony and Marshal Canons, is on the same ledge, northwest, as the Perkins, that has acquired, of late, so high a reputation. The Darra is owned by Messrs. Roberts and Schmidt, who, by hard labor have opened it to a considerable depth, and traced it the whole length of their claim, 800 feet. Some thirty or forty tons of rock have been taken out and worked at several mills, paying from fifty to two hundred and fifty dollars per ton. As the claim is near the city and the mills are of easy access it improves its value materially.

WASHOE.

THE Gold Hill *News* thinks that with the opening of Spring will come a grand revival in mining operations in Nevada. That paper says that the depression of the past few months has not grown out of a want of confidence in the mineral wealth of that State. The fact of the reality of such wealth is too apparent for doubt, and almost daily developments confirm the opinion of the miner and the geologist. Not long ago much excitement was created by promising strikes on American Flat. A crowd rushed to that locality, the land was soon staked out in claims, and work vigorously commenced. But hard times coming on, many abandoned the enterprise for the want of means to carry it through. It is no evidence, however, that the mines on American Flat are worthless. Capital is needed to develop them, and it is believed that it will come with Spring, when work can be recommenced with less inconvenience and cost.

SOME excitement was caused the past week by the reports of rich discoveries in a new district lying between Steamboat Springs and the Truckee river. The ore is said to be argentiferous galena, containing an unusually large percentage of silver. A number of prospectors have been out to hunt claims. Assays show it to be rich in silver and copper, with a trace of gold.

THE fine new mill of the New York and Washoe Company, on Washoe Lake, has started, and works admirably. The Manhattan Mill, owned by the same company, is also in full and successful operation. The company have some eight hundred tons of ore on hand.

ACCORDING to the *Enterprise*, a piece of rock was taken out of the Belcher mine, some days since, which yielded at the rate per ton, in gold and silver, of $15,300.97.

THE Imperial mine, Gold Hill, is yielding a large amount of excellent ore at the present present time. It is a splendid mine.

THE Yellow Jacket has recently struck a fine lead of black sulphurets in the lower level of the mine, which has been traced longitudinally about one hundred feet. This is a most important development for that mine.

THE Confidence has recently turned out some very fine ore from the south part of the claim, some of which showed sulphurets and native silver quite freely. Many rich developments have been made in Desert District, and the mines of that region are begining to be looked upon with much favor. Thirty pounds of rock were recently taken to Virginia from the Amador lead, in the district named, which, on being worked, yielded a silver bar worth $11.29.

AMERICAN FLAT.—The Gold Hill *News* says that the interest in American Flat is reviving, and that there are now several companies mining in that district, with good prospects. The Rock Island Company have struck a ledge eighty feet wide, and the rock already taken out, it is calculated, will yield over $30 per ton. This strike will have a tendency to increase the value of other mining claims in that vicinity, and induce their owners to resume work upon them as soon as the season and the times will allow.

SILVER MOUNTAIN.

The Monitor *Gazette* of Jan. 14th says that a spirit of judicious earnestness seems to be manifesting itself in mining movements at Silver Mountain, not before discernible in the working of mines in that locality. The stockholders in the numerous valuable ledges in that district, having by dear bought experience ascertained that "top scratching" will never develop their riches, are now commencing their tunnels at points that will cross their ledges at a depth beneath all superficial disturbing causes.

THE GEORGE WASHINGTON COMPANY are running their tunnel in on the ledge, and for every foot in length, they gain one in depth; they are now taking out some splendid rock, which improves as they go in. Had the Mountain Company expended the labor of the past four seasons upon their present tunnel, they would long ere this have been issuing bullion.

THE MOUNTAIN LODE.—The paper above quoted, gives the following particulars in relation to the discovery and present condition of the celebrated "Mountain Lode:"—

Three men, named respectively John Johnson, — Harris, and — Perry, in prospecting the eastern slope for mineral, discovered from a distance the massive croppings of the celebrated Mountain lode, at what is now known as Silver Mountain, (the original name being Konigsburg.) This was in the fall of 1860; no locations were made, however, until June, 1861, when the Mountain No. 1 and Silver Creek Companies were located, and work commenced upon them. Soon after, other locations were made upon the same ledge, commencing upon the north with the Mammoth, 3,000 feet; Silver Creek 3,000 feet; Mountain, 2,750 feet; Jefferson, 3,000 feet; Washington, 3,000 feet, and the Astor, 2,000 feet. The croppings of this ledge are probably the best defined of any this side of the mountains, exhibiting a bold outcrop continuously for a distance of over five miles, without a break. We visited the Mountain No. 1 on Monday last, in company with the President—Hon. Sextus Shearer—and the Superintendent, J. A. McCuen, and several other gentlemen. We entered the lower tunnel, now in 160 feet, six and a half by seven feet in the clear, calculated for a double track. By a survey they will cut the Mountain lode 1,100 feet from the mouth of the tunnel. Before reaching the main ledge they will cross two other ledges—the first one about fifty feet ahead, and the other in about 200 feet. The first one from the croppings, will be narrow, but the second about nine feet wide. They expect to find rock in one or the other of these two ledges sufficiently rich to pay for cutting the balance of the tunnel, which will tap the ledge 950 feet beneath the croppings. A tunnel was commenced in 1861, which, after running 310 feet, crossed the ledge 80 feet beneath the surface croppings, which was forty feet in thickness, assaying from $2 to $181 to the ton, nearly all silver. The company have a dump of a capacity for all the waste rock for a long term of years. Immediately in front of the mouth of the tunnel, on Silver Creek, they have a mill site.

On Monday evening after we left, the hands on the night shift cut the first ledge, and we are informed that the rock looks well, and may realize to the company all they anticipated from the second ledge—which was to pay the expenses of the tunnel from that point until it pierced the main Mountain lode.

ESMERALDA.

The mining interest about Esmeralda, at the present time seems to be centering in the outside districts, where it is reported important developments are constantly being made. We have elsewhere made lengthy allusion to the furnace operations in progress in the Montgomery district. The Esmeralda *Union* says that everybody appears to be satisfied with regard to the quality of the rock there—the only question is as to quantity, and says: "Should the leads improve in size, and an abundance of such rock as we have seen, be found, means will soon be discovered to obviate the difficulty at present experienced in smelting and amalgamating."

MILL FOR OWEN'S RIVER.—A fine lot of machinery for a quartz mill arrived at Wilmington, Los Angeles county, on the 21st instant, *en route* for the mine of Messrs. Mitchel & Owens, at Owens river.

HUMBOLDT.

The Evening Star Company shipped on the 14th instant, bullion to the amount of $1,145. The bricks, four in number, were almost pure silver, running from .938 to .949. Mr. Joseph Voshay has recently been appointed Superintendent of this company's mine.

THE PROSPECT.—Ferguson and Hollis are making further examination of this ledge, and they find it widening rapidly. The ore is not carried in a thin lode in one part of the ledge, as is the case in many ledges, near the surface, but is generally diffused through the entire body of the ledge; and is more plentiful, and purer, in the bottom of the shaft, than ever before found. Ferguson assures the editor of the *Humboldt Register* that he can keep on down with this shaft, and make the ledge pay for prospecting, and something beside.

TO CORRESPONDENTS.—No. 3 of the interesting series of articles by Prof. Lanzweert, on "The Problem of Gold and Silver Extraction," is unavoidably laid over until next week. A communication from Thos. Rowlandson, on the question, "Is the Presence of Hot Water in Mines a Beneficial Indication, or Otherwise?" was received too late for insertion this week. An interesting letter on the mines of Grass Valley, from Prof. Blake, is necessarily postponed until next week.

A Communication from "J. St. J." came to hand just as we were going to press; too late to receive attention this week.

A CALIFORNIA INVENTOR ABROAD.—Mr. Edward Fay, of Petaluma, who left here some months ago to introduce a new warlike machine, which was fully described at the time in the columns of the PRESS, according to the Alta, has written to a friend in this city as follows:

Major-General Butler and Gen. Banks, and several other prominent military men, have approved of my Portable Shield and Breast Works; also a new invention of mine, a time torpedo, that will explode at any given time, under water or under ground. Butler orders ten of the light shields to make a test, but on account of some military etiquette the Government will not build them without a written order from Gen. Grant. I have not yet been able to get an interview with him, so I have to build them. Butler pays for two of the torpedoes at his own expense. On the whole my prospects are flattering.

WILLIAM BURR, the inventor of the casemate iron-clad system, died a few days since at Greenfield Hill, Connecticut. It was from the stolen plans of Mr. Burr that the rebel ram Merrimac was built.

THE EUROPEAN METALLURGICAL WORKS.

We visited these works, located on Bryant, between Third and Fourth streets, a few days since, and found them busily employed in the metallurgical operations, of roasting, grinding and separating the ores, and in amalgamating and assaying the metals and minerals. The works are under the charge of Messrs. Kimball and Murphy, proprietors. They have established a school for young men, who desire to study practical metallurgy. Their workmen are chiefly students, some of whom are skillful chemists and assayers, who are here undergoing a pupilage, to fit themselves for mine and mill superintendents. Several have graduated and gone out during the past summer, to take charge of mining establishments in the mountains. Some have been assigned to mines where work has been suspended on account of the difficulty experienced in the working of the ores. At present there are six students there, two of whom are already under an engagement to take charge of the working of silver mines.

The Works embrace a stamp mill and a great variety of pans and separators, which are driven by a steam engine; also furnaces for roasting ore, and smaller ones for the laboratory, with which latter are connected a full complement of all the needful tools and materials for assaying. The proprietors furnished us with the following memoranda, from their books, which will give some idea of the richnes of much of the ore which is constantly being sent to this city, in quantities to be submitted to a regular mill process of treatment:—

Silver Chamber Lead, Reese River; per ton yield, by working process, $1850.50 per ton, silver; gold, none. Assay $2100.50.

Continuation of Osceola Claim, Montgomery District, Esmeralda, $1816.42 silver, no gold. Assay $2053.24.

Burning Moseow, $149.19 silver, $266.71 gold—total, $415.90; Assay $509.96.

Mineral Hill Lead, White Mountain District, from Rock Tunnel, $11,200.00 per ton, gold.

Ores from Tuolumne County, from the Argentine Company—four tons worked. Yield, $49.00 gold, $5.00 silver, per ton.

From the same county, 1750 pounds of ore from Mr. Hessian, yield $80.54 gold; $5.00 silver per ton.

Monitor claim, same county, yield $188.50 per ton, gold; assay $201.25.

These works now claim to be working sulphurets up to 90 per cent of the assay.

THE EUREKA PATENT BLASTING POWDER COMPANY is the style of a company recently organized in this city for the manufacture of a new blasting powder, without the use of saltpetre. We have previously noticed the manufacture of this powder in Grass Valley, Nevada county, where it is known as sawdust blasting powder. We gave at the time a full description of the powder and its value, especially for mining purposes. We have since been informed that the company organized in this city claim the exclusive right to manufacture the powder on the Pacific coast, holding their title from the patentees at the East. This powder is furnished at a price much below that of the common blasting powder, and is destined to come into general use for ordinary blasting purposes. The company organized in this city consists of John B. Owens, Daniel Mitchell, and Charles A. James. They have recently commenced its manufacture on the San Bruno road, just out of this city. Four men can make one hundred kegs daily. Numerous trials of this powder have been made in various parts of the mines and in this city, and it has invariably given the most perfect satisfaction.

PROFESSOR BLAKE, of this city, has just returned from a professional trip to Grass Valley, whither he went to examine and report upon some of the mines of that famous region. We understand that the Professor fully agrees with all late visitors as to the general wealth of the mines of that locality.

TAXING THE MINES.—The Senate of Nevada has adopted a concurrent resolution protesting against the taxing and selling of the mineral lands for Government purposes, as recommended by the Secretary of the Treasury.

"The Cottage Cyclopedia of History and Biography—A Copious Dictionary of Memorable Persons, Events, Places and Things, with Notices of the Present State of the Principal Countries and Nations of the Known World, and a Chronological View of American History."

The above is the voluminous title of a really useful cyclopedia, embraciag, within the compass of about 1,000 pages, a vast amount of facts desirable for knowledge and reference. The book is designed as an assistant to the general reader. Every one who is in the habit of reading, without a library at hand, has often felt the inconvenience of meeting frequent references to dates, and to historical, biographical, and other subjects, to which, in the absence of a library, he is not able to refer for more particular information. This book is designed to take the place of a library in such cases. Such are the uses of all encyclopedias; but such expensive and voluminous works as the Britanica and American Encyclopedias are beyond the reach of individuals of ordinary means, and the work now before us has been compiled with especial reference to placing a cyclopedia within the reach of all—hence its title of "Cottage Cyclopedia." R. J. Trumbull, at 302 Montgomery street, is the California agent for this work.

Now in Its Tenth Volume!

—THE—

Mining and Scientific Press,

—THE MOST—

Profitable Newspaper

—FOR THE—

Readers of the Pacific Coast.

Issued Every Saturday Morning.

DEWEY & CO., Publishers.

Our Journal enters its Tenth Volume with marked prosperity and improved facilities and resources for furnishing a handsome, valuable and well filled sheet.

We believe that the Press furnishes more information of ready application and intrinsic value to its readers than any other journal on this side of the Continent. Its circulation has doubled during the past year, and, for the economy and interests of the industrial classes of this and neighboring States, its subscription list should be more than trebled for the ensuing twelve months.

We shall continue to make the Mining and Scientific Press substantially

An Instructor to Prospectors,
An Economist to Millmen,
An Assistant to Active Miners,
An Economizer for Mining Advertisers,
A Reliable Reporter for Shareholders.
A Faithful Monitor for Stockdealers,
An Intelligencer for Mechanics,
An Incentive to Inventors,
A Reflector for Patentees,
And a Helpmeet to all Industrial Classes

Upon the Pacific Coast. We shall give accurate and frequent

THE SHAREHOLDERS' DIRECTORY

Will comprise a record of all Notices of Meetings of Mining Companies, Notices of Assessments, amounts levied, date of advertising sales, and day of sales, announced in all advertisements appearing in the San Francisco papers during the period of the Volume.

FOR SENDING ABROAD.

As a paper for mailing regularly to your friends in the East or to correspondents elsewhere, none can be selected more appropriate, or better calculated to dispense reliable information with regard to transpiring events on this coast and the progress of California.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News dealers, acting as our agents, will receive liberal commissions.

Friends pleased with our efforts in the publication of the Press can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

SUBSCRIPTION IN ADVANCE.

One Year, (two volumes).....$5.00
Six Months, (one volume).....3.00

FOR ADVERTISING

Our terms are very reasonable. Mining Companies are especially favored by our rates, and careful attention is given to the publication of Mining Notices.

Office in Government House, Nos. 11 and 55, corner of Washington and Sansome streets, San Francisco.

DEWEY & CO., Publishers.

C. W. M. SMITH.....W. B. EWER.....A. T. DEWEY.

PACIFIC MAIL STEAMSHIP CO.

The following Steamships will be dispatched in the month of February, 1865:

Feb. 3—GOLDEN AGE.....Capt. E. S. Farnsworth

Feb. 13—CONSTITUTION.....Capt. J. T. Watkins

Feb. 23—SACRAMENTO.....Capt. Wm. H. Hudson

From Folsom Street Wharf,

At 10 o'clock A. M., punctually to the hour,

For Panama.

Passengers will be conveyed from Panama to Aspinwall by the Panama Railroad Company, and from Aspinwall to New York by the Atlantic and Pacific Steamship Company.

OLIVER ELDRIDGE, Agent.

Corner Sacramento and Leidesdorff sts.

[ADVERTISEMENT.]

To the Public, and to Millmen in Particular.

As Thomas Varney has not, up to this date, withdrawn his notice in the "Mining and Scientific Press," in which appears the following language:—

"All persons are warned against purchasing machines made at the Miners' Foundry, called 'Wheeler's Amalgamators,' as they are an infringement on my patent, and a suit is now pending in the United States Circuit Court, against the parties infringing;"

In justice to myself I am compelled to give to the public a statement of the facts in the case, and show the position which Mr. Varney and myself occupy as Patentees. He commenced suit against me, and the Miners' Foundry, for $00 000, about the 1st of March 1863, and threatened suit against any and all persons who should buy my amalgamators, thus greatly damaging my business. To show the injustice of this suit against a "poor hard working mechanic," I will quote from the opinion of Judge Hoffman, as rendered in the case last November. He says:

This is an action for the infringement of a patent issued to the plaintiff on the 16th of December, 1862, for an "improvement in Amalgamators for gold and silver." The machine alleged to be an infringement has also been patented—the patent being dated December 8th, 1863. The defendants deny the alleged infringements, and the novelty and originality of the plaintiff's invention. They have also given notice, under the statute, of various other defences, hereafter to be noticed.

Models of the two machines were exhibited in Court, and a large number of witnesses called to explain their construction and mode of operation. It is apparent that the patented machine of the defendant closely resembles, if it be not substantially identical with, the improved and modified machine now manufactured by the plaintiff. But the inquiry is not whether Wheeler's machine resembles that lately used by Varney, but whether the former is substantially the same as the machine described in Varney's patent. That Varney has, in many important particulars, modified the machine as described in his patent, is obvious. Indeed, his late machines resemble much more nearly in external appearance, and in their mode of operation, the Wheeler patented machine than they do machine constructed according to the drawings and specifications of his patent.

After describing Mr. Varney's pan and its operation, the Judge says:

It appears, however, that the idea of working ores in a batch, by causing them to pass repeatedly between mullers, the upper one of which is provided with openings at the center, is by no means novel.

J. E. Clayton testifies that, so long ago as 1845, he arranged a machine in Tallahoosa, Alabama, for the reduction of gold ores, which embodied substantially the same principle.

* * * * * * *

In Overman's Metallurgy, p 267, a similar arrangement is described. * * * It is evident that the author is here describing an existing and well known machine, the usefulness of which has already been ascertained.

It is also apparent that the result aimed at in the same in this machine as in that of the plaintiff, and that the means adopted to accomplish it are substantially similar. In both machines the pulverization of the ore is effected by means of a fixed plate upon which a muller rotates, with central openings to permit the pulp to pass continuously and repeatedly between the grinding surfaces until the operation is completed.

Amongst other things the Judge quotes the following from Judge Story:

But in all cases where the patentee claims anything as his own invention in his specification, Courts of law cannot reject the claim, and if included in the patent and found, not to be new, the patent is void, however small and unimportant such asserted invention may be.

* * * * * * *

Here the plaintiff claims a particular position of machinery as his invention, and it clearly appears in evidence that the position is not new. It has existed before—not in machines exactly like the present, but in machines applied to analogous purposes, viz: in machines applied for the same purpose as the plaintiff applies them. The objection therefore is fatal.

In the defendant's machine, the pan in two parts, provided with flanges, packing, &c., to which the plaintiff in his patent attaches so much importance, is not used, but a deep pan is substituted with a wooden cover.

The arrangement of the slots or shoes on the muller is different. The upper muller is provided with spiral ridges arranged to operate with similar ridges reversely inclined on the inner surface of the pan, to raise the pulp and promote the circulation. The upper muller is attached to the shaft by an universal joint, and by a mechanism quite dissimilar to that described by the plaintiff. And for the scrapers are substituted broad guide plates extending and secured to the edge of the pan, and capable of being elevated or depressed by means of a mechanism not found in the plaintiff's machines.

Assuming then—as in the point of view in which we are considering it we must—that each of the several parts of the plaintiff's machine is old, and not separately patentable, it seems clear to me that if the patent for the machine can be sustained, as for a new combination; which I think doubtful, the combination of the defendant is at least as novel as that of the plaintiff.

We have already seen that the muller rotating upon a fixed plate, with central openings, and arranged in a pan so as to create a circulation of the pulp, is not a new invention. The tub, composed of two parts, with flanges, packing, &c., is not claimed to have been used by the defendant. In fact it is now discarded by the plaintiff, and a deep pan, with muller attached by an universal joint, has been adopted by him in his later machines. The infringement, if any, must consist in the use by the defendant of the scrapers described in the plaintiff's patent.

The inquiry thus arises—are the curved plates described in Wheeler's patent, substantially the same in their structure and operation as the scrapers of the Varney patent, and if so, do the latter constitute a "material and substantial part of the things patented by Varney, definably distinguishable from the other part." To determine this question, a brief description of Wheeler's machine is necessary.

The Judge then describes the Wheeler pan and the Varney pan and scrapers, and says:

In the Wheeler pan four plates are used while Varney employs only two scrapers. The form or curve given to these plates in both machines is similar, though not identical; but in their structure, arrangement, and the use for which they are intended, there is an essential difference. The scrapers of Varney are represented as of inconsiderable width, and extending from a ring at the center to the periphery of the muller—they rest apparently upon the surface of the muller, and no means of elevating or depressing them are mentioned in the specifications or exhibited in the drawings.

The plates of Wheeler are of considerable width, and attached to a frame suspended, from the top of the shaft, resting upon a vertical screw, by means of which the frame and plates attached to it may be elevated or depressed. The plates extend to the inner surface of the pan, where they are secured by slides. The office of these plates, as described in Wheeler's patent, has already been mentioned. It appears to me that the scrapers of Varney neither serve, nor were intended to serve, any such purpose. [Here the Judge gives his reasons for the above opinion.]

For these reasons I am of opinion that the curved plates of Wheeler differ from the scrapers of Varney in their form and arrangement, their object and effect, and that therefore their use is not an infringement of Varney's patent.

Much testimony was taken to show that in fact Wheeler's invention was prior to that of Varney's and that the latter derived his ideas from the former

It is claimed by Varney that his invention was, in its essential features, matured and perfected in August, 1861 but this statement seems hardly consistent with his declarations or his conduct.

Varney's application for his first patent was not made until the end of October, 1861. That machine has since been discarded as useless.

If then, at the time of this application, he had already matured and perfected the invention of another and far better machine, he committed a practical fraud upon the public in withholding from them the benefit of his skill and ingenuity. It is certainly strange that he should have gone to the trouble and expense of procuring a patent for his first machine, and delayed, for nearly a year, his application for a patent for the improved machine which he had, as he says, already invented.

It may well be doubted whether, if it be true as Varney states, that at the time of his application for his first patent he had already completed and perfected his improved machine, the suppression would not be fatal to both. It appears in evidence that, as early as December, 1861, Wheeler had conceived and communicated to Stewart & Kirkpatrick at Washoe, the idea of his machine. He explained to them the mode in which the circulation, or over and under current was to be produced, and the guide boards by which it was to be assisted.

In January, 1862, drawings of this machine were received at the Miner's foundry, and Stewart, the partner of Churchill, was desirous of having his pans constructed on that plan. The theory and construction of the proposed pan were fully explained to Varney, who succeeded, however, by affecting to consider Wheeler's pan a "humbug," in dissuading the parties from adopting it, and in inducing them to order pans made on the model of his own patent. These were subsequently discarded as useless. We are driven to adopt one of two suppositions: either that Varney wilfully deceived Stewart in inducing him to order an inferior pan, or else that he had not at that time discovered the mode of producing the over and under current, recognized its utility and invented a machine to effect it.

Wheeler commenced manufacturing his machines in January, 1862. He commenced using them in June of the same year. They were constructed at the Miners' Foundry by the defendants to this cause, under the immediate observation of Varney. But in his conversation with Scott, in July, 1862, and in his communications with the defendants, he does not appear to have intimated that he was the first inventor of the Wheeler machine, and that in constructing the latter they were violating his rights. Up to the end of 1862, he continued to have his own pans built at the same foundry; and if he really considered the construction of Wheeler's pans to be an infringement of his own invention, his silence is inexplicable. His delay in applying for his second patent is equally unaccountable. In August, 1861, he had, as he says, completed and perfected his invention of his improved machine, and yet in October of that year he applies for a patent for his first and imperfect invention, and delays his application for a patent for his improved and perfected machine until the end of June, 1862—more than a month after Wheeler had taken the preliminary steps to obtain his patent.

It is unnecessary, however, to pursue this inquiry further, for in the view I have taken of the case the question of priority of invention is immaterial.

The Judge then notices the other grounds of defence, and says:

If this view of the effect of that statute be correct, it affords a defence to Wheeler as well as the other defendants. It is not pretended that he has used any machines not manufactured by them, or that he has infringed the plaintiff's rights, otherwise than by receiving from the other defendants the sum agreed to be paid by them on the sale of his machines."

I find, therefore, for the defendants.

[In this candid statement to the public, I should have preferred to have given the decision of the Judge and the findings of the Court in full, but for the great length of space they would occupy; and I will state that the same can be found in the "Mining and Scientific Press," of December 10th and 31st, 1864, and invite their thorough perusal.]

It will be seen by the above statements that Mr. Varney is infringing on my patent right by the use of wide guide plates in his pans, instead of my infringing on his patent. The truth is, he never used any but narrow scrapers in his pans until after I had put my pans in operation, and they had proved a success. None of his pans made prior to the year 1863 ever run six weeks without being condemned and thrown aside. This may account for the fact that he afterwards altered his patterns and made them like mine, with an open, deep pan, and wide guide plat s instead of scrapers, and put a wooden cover on the pans.

Having established my right in my patent Amalgamator, it is now my turn to protect myself against the infringement of "Mr. Varney, or any other man," and I intend to do it; and all persons are hereby warned not to purchase or use machines called "Varney's Amalgamators," as made at the Union Foundry, Pacific Foundry, or any other place, as they will make themselves liable for an infringement on my patent right.

Having made some important improvements in my Amalgamators, the public are invited to call and examine them at the Miners' Foundry, San Francisco, or at Prescott & Schiedel's Foundry, Marysville, where they are manufactured. ZENAS WHEELER.

1852. 1865.

Thirteenth Year of Publication.

THE GOLDEN ERA,

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, The Golden Era is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

The Golden Era is now enlarged by the addition of eight columns to its pages—and presents fifty six columns containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render The Golden Era a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome The Golden Era as a regular weekly visitor.

Serial Romances in the Golden Era.

The most popular Novels of the present day are published as Serials, from week to week, in The Golden Era, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the Contributors to the Golden Era are all the prominent writers of Literary Repute in California, and on the Pacific Coast; also correspondents and contributors of distinguished talent in the Atlantic States and Europe; including "Orpheus C. Kerr," Fitz Hugh Ludlow, G. B. Densmore, "Mark Twain," Dan De Quille, Florence Fane, Miss Emma Hardinge, Sarah E. Carmichael, Annie E. Fitzgerald, "Oceana Owen," Alice Mason, William Simpson, Chas. F. Stoddart, "Ina," H. G. Williston, "Albion," "Fairfax," Boonevel, Mary Kyle Dallas, Margaret Hosmer, and many other accomplished writers of Fiction, Romance, Novels and Stories, Poetry, Essays, Sketches, etc., etc., comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States or Europe.

Subscriptions to be Paid in Advance.

ONE YEAR $4. SIX MONTHS $2. THREE MONTHS $1.

Take care to write distinctly the name of the person; the name of the city, town or locality where the Post office is situated, and the name of the County and State, in order that the paper may be fully and accurately directed to every address.

THE GOLDEN ERA TO CLUBS.

Parties (living remote from localities where agents are located) forming a club of five yearly or half-yearly subscribers, and forwarding the subscriptions (by letter registered and postage paid) to the office of publication in San Francisco, will be entitled to an additional copy of The Golden Era for the term of one year, or to retain the equivalent in cash.

AGENTS in every part of the State receive subscribtions or the Golden Era.

POSTMASTERS in California, Oregon, and neighboring Territories, obtaining subscriptions for the Golden Era and forwarding the same, with name and address of the subscriber, will be allowed a commission therefor.

PARTIES residing in localities where no Agents are established will forward their subscriptions by mail.

SUBSCRIBERS will be careful in writing as plainly and fully as possible, the direction of papers to be sent to any part of California, the Atlantic States, or elsewhere.

Now is the Time to Subscribe.

TO ADVERTISERS!

Best Advertising Medium—The "Golden Era" is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village, and mining and agricultural precinct in California, and offers unusual and unequaled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

GOLDEN ERA POSTAGE.

Postage on the Golden Era, to Mail Subscribers, in California and throughout all the States and Territories of the Union, per quarter, (3 months).... 5 cts. To be paid quarterly, in advance, either at the Office of Mailing or Delivery.

Postage on the Golden Era, Single Copies, transient, to be prepaid by stamps..... 2 cts.

BROOKS & LAWRENCE,

Golden Era Building,

543 Clay st., near Montgomery, San Francisco

IMPORTANT IF TRUE.—The following receipt for producing perspiration is certainly very valuable if it will accomplish the object. An exchange says :—

Take a piece of lime about half the size of your closed hand, and wrap around it a wet cloth sufficiently wrung to prevent water from running from it—a dry cloth is to be several times wrapped round this, place one of these packets on each side, and by both thighs (a few inches from them) of the patient; an abundant humid heat is soon developed by the action of the water upon the lime, which quickly induces copious perspiration, the effect lasting for two hours at least. When sweating is fully established the lime may be withdrawn, which is now reduced to powder. In this way neither copious drinks nor loading the bed with covering is required.

EDWARD EVERETT was a man of unbounded versatility, but not great; he lacked something essential to greatness, and, with greater scholastic refinement, will never rank with Webster and Clay. As an orator, he was smooth, beautiful and scholastic; as a statesman, timorous and conservative; as a man, good and memorable. He was an orator without true eloquence, and a poet without imagination. He was the silver-flashing and abounding river that rolls in majesty through the savannah, not the rushing, impetuous torrent that parts the crags and plows a channel among the obdurate rocks.—*American Flag.*

POTOSI VS. BAJAZET.—This case, says the Virginia Union, excited a great deal of interest, upon the supposition that it involved the one ledge theory, and, doubtless, many believe the result to be in favor of that theory; but we are informed by a member of the jury that such was not the case. The question decided, he informs us, was one of location merely, and the identity of certain stakes set by the Potosi at the time of location. The decision certainly was a surprise to many. Two decisions have now been rendered in this suit without touching the one ledge theory. Both judges and jurors seem to prefer deciding other points first.

THE TONGUE.—Is not an indispensible organ of taste, as is commonly supposed. Blumenbach saw an adult, and in other respects a well-informed man, who was born without a tongue. He could distinguish, nevertheless, very easily the taste of solutions of salt, sugar, and aloes, rubbed on his palate, and would express the taste of each in writing.

NEW MILL COMPANY.—A Company called the Ogden Mill Company was incorporated on Saturday with a capital of $150,000. The Company is formed for the purpose of working gold and silver ores, in the mill or mills of the Company, situated in Storey County, State of Nevada. The Trustees elected for the first three months are F. Ogden, O. S. Carvelle, and H. R. Covey.

LABOR.—Four of the manufacturing corporations of Lowell, Masachusetts, pay out to operatives the sum of $2,700,000 per annum.

NEARLY 12,000 yards of fancy cassimeres are manufactured weekly at the Taconic mills, Pittsfield.

For Advertising Assessments on Saturdays.

Levy your Assessments upon any day EXCEPT FRIDAY.

Advertise the ASSESSMENT NOTICE on the FIRST FOUR SATURDAYS succeeding the day upon which the assessment is levied.

Appoint the day for advertising the DELINQUENT SALE on the FIFTH SATURDAY succeeding the date of levying the assessment.

Appoint the DAY OF SALE on the SEVENTH SATURDAY succeeding the date of levying the assessment, or any day *previous* to the Eighth Saturday.

Assessments ordered upon Saturday afford the Secretary the longest term in which to effect his advertising at the mine.

Extracts from the Statutes.

The attention of companies who desire advertising their delinquent sales in any other paper than that in which the notice of assessment appears, is called to the following section of the law approved April 4th, 1864:

Section 7. If any portion of the assessment mentioned in said notice shall remain unpaid on the day specified therein for the publication of the notice of sale, the Secretary shall, *unless otherwise ordered by the Board of Trustees*, cause to be published in the same papers in which the notice provided for in section five shall have been published, a notice substantially as follows, &c.

If, from a matter of convenience or necessity, the publication of an assessment is delayed, a very simple remedy is found in the following section of the law, relating thereto:

Section 14. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the nonperformance of any act required to be performed in order to enforce the payment of the same; but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall be void, and publication shall be begun anew.

To Mining Secretaries.

We positively refuse hereafter to receive advertisements of any mining company for the payment of which the Secretary is unwilling to vouch. We shall also exercise the right to eject from our columns, at any time during the course of publication, any advertisement for which payment is not made, or security given upon proper notification.

A Just Tribute.—Some twenty years ago, Edward Everett delivered an address before the Mechanics' Society of Springfield, Mass., in which the following sublime simile occurs :—

"In the great temple of Nature, whose foundation is the earth, whose pillars are the eternal hills, whose roof is the starlit sky, whose organ tones are the whispering breeze and the sounding storm, whose architect is God, there is no ministry more sacred than that of the intellectual mechanic."

Overland Mail Time.—The schedule time of the Overland Mail from Atchison, Kansas, to Salt Lake, is ten days and three hours; from Salt Lake to Placerville, five days and twenty-one hours—sixteen days through. This contract is to continue for four years.

Valuable Mine.—C. T. Meader, of Stockton, has purchased of Thos. Hardy his one-fourth interest in the Union Copper Mine, at Copperopolis. The entire mine is said to be valued at $2,000,000.

There is an amendment proposed to the Constitution of the United States providing for the election of President and Vice President of the United States by direct vote of the people.

Pocotaligo, or Co.—Lippincott's Gazetteer spells this word "Pocotalico." The maps print it "Pocotaligo." Which is right?—*Sac. Bee.*

It is pronounced and spelt by the citizens of South Carolina, Pocotaligo.

Virginia City and Gold Hill have refused to consolidate.

Fine indications of copper mines it is said have been discovered by prospectors on Sooke river.

Any one who wishes to lay out a half million of dollars, can do so at Bristol, Eng., where a working-man has discovered perpetual motion, after twenty years study, and claims that modest sum for it.

Porter's fleet against Wilmington consisted of 74 vessels and tugs, carrying 667 guns—the largest armada ever known.

Our Patent Agency.

The Patent Agency of the Mining and Scientific Press has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

RICHARD WEGENER,
Accountant, Mining Secretary,
AND GENERAL AGENT.

IMPORTANT DISCOVERY
— IN THE —
Photographic Art.
Jacob Shew's
CHROMATIC PROCESS OF PRINTING PHOTOGRAPHS.
[PATENT APPLIED FOR.]

THE UNDERSIGNED WOULD ANNOUNCE TO THE public that he has discovered a new and IMPROVED PROCESS for printing Photographs, which produces a

SOFTNESS, CLEARNESS AND DELICACY OF TONE

unattainable by any other known process and to which he has given the above name. It is applicable to any size of Photograph, and those having valuable old negatives which they desire printed by the improved process can do so at any time.

In order to secure the pecuniary advantages to be derived from this important discovery a patent has been applied for. When obtained, the privileges of the right will be disposed of at a reasonable rate to any Photographer desiring it. In the meantime all are warned against encroachments upon the rights of the discoverer as such will be prosecuted to the full extent of the law.

"Cartes de Visite" and large Photographs printed by this process will be furnished at the prices of the ordinary work of other establishments.

☞ The public are invited to examine specimens at my Gallery. ☜ JACOB SHEW.

BAUX & GUIOD'S
Separator & Amalgamator

is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refuse, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

Machinists and Foundries.

NOVELTY IRON WORKS,
Steam Engine, Boiler and Machine Shops.

STEAM ENGINES AND BOILERS OF ALL KINDS ON Hand and Made to Order. Quartz, Saw and Flour Mills and all other kinds of Machinery, Made to Order, Bought, Sold, or Exchanged.

Reynolds' Variable Cut-Off Saves from 25 to 60 per cent. of Fuel.

WINANS' ANTI-INCRUSTATION POWDER for Steam Boilers, a *SURE REMEDY*. Send for Circular.

A Boiler and Engine, in complete order, of the capacity of Twenty-five Horse Power.
19 Inquire at this office.

THE PACIFIC IRON WORKS,
First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above works, invite the attention of all parties interested, to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting machinery of the most approved construction, Flour, Saw and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

Vulcan Iron Works Company
[ESTABLISHED 1850.]
First, Natoma and Fremont Sts.
IRON FOUNDERS,
Steam Engine and Locomotive BUILDERS,
Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These works have lately been increased by the addition of new shops on Fremont Street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequaled in the State. Their Boiler Works have also been enlarged correspondingly.

The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as

Mining, Steamship, and Steamboat Machinery,
Railroad Machinery, Flouring Mills,
Locomotives, Quartz Mills,
Car Trucks, Sugar Mills,
Car Wheels, Saw Mills,
Housings and Irons; and
Manufacturing Machinery of Every Kind.

Sole Manufacturers of
HEPBURN & PETERSON'S REDUCING PAN AND AMALGAMATOR;
MOORE'S IMPROVED HOWELL QUARTZ CRUSHER;
HOPE'S AMALGAMATOR AND SEPARATOR;
FAUCHERY'S QUARTZ GRINDER AND WATER WHEEL;
JONVAL'S IMPROVED WATER WHEEL;
STEVENS' PISTON PACKING RINGS.

They have also a large assortment of Patterns for Pumping and Hoisting Machinery, Gearing, Pullies, Water Mill Irons, Hydraulic and Screw Presses, Retorts, Furnaces, Grate Bars, House Fronts, Ornamental Fence Posts and Paling, Stoves, Ranges, etc., etc.

Quartz Stampers, Shoes and Dies, of the best Hard Iron. Quartz Screens of Russia Iron Punched to Order. 27

Old Stand, corner Bush and Market Streets. Opposite Oriental Hotel, San Francisco, Cal.

AN ESMERALDA HAND MILL.—The Esmeralda *Union* gives the following description of "Morton's Hand Quartz Mill," recently constructed in the vicinity of Aurora:

This mill, though hastily erected as an experiment, works charmingly. It is simply a battery with two stamps made of quicksilver flasks, worked by a crank, which is connected with an amalgamating pan by means of a small leather belt. As the man turns the crank the stamps rise and fall, the rock becomes pulverized and runs from the battery through a very fine sieve, with the water which is constantly running into the battery from a barrel near by, and the belt gives motion to the mullers in the amalgamating pan, which is situated upon a brick fire-place. The simplicity of the whole contrivance is remarkable.

COPPER.—The mines at Copperopolis and several other points in the State are being developed with prudence and a good degree of energy. The amount received at San Francisco during 1864 was 14,300 tons, valued at $1,094,660, against 5,900 tons, valued at $512,000 the preceding year. The amount raised the coming year it is believed will be much larger than last. All the ore containing ten per cent. or more of metal delivered in San Francisco sells readily for cash.

Machinery.

IMPORTANT INVENTION.

Hunter's Concentrator, Amalgamator and Separator.

For the concentration of Gold, Silver and Copper ores, and separating all kinds of metals from the sands, where the specific gravity of the metal is greater than that of the rock, a machine is now on exhibition at the SAN FRANCISCO IRON WORKS, N. E. corner of Mission and Fremont streets, where it will be running from two to three o'clock P. M., for the inspection of all interested in mining. The Inventor is prepared to manufacture machines to supply all orders promptly. The sixth of a horse power is sufficient to run one of these machines. For the above machine a patent has been applied for. Orders for machines, or for circulars and further information, should be addressed to

ANDREW HUNTER, Inventor.

The following extracts from Reports are submitted to the public as giving the results of a fair working test of these machines:

BEAR VALLEY, DEC. 12, 1864.

MR. A. HUNTER—*Dear Sir:* I take pleasure in stating, in reply to your request, that your concentrator has now been running minute ruptedly, at Princeton Mill, for more than three weeks, and the enclosed notes, by the Superintendent Mr. Williams, of a carefully measured test of its performance during a period of a day and three-quarters, I believe fairly indicates what it has been doing through the whole of that time. First, the loss of the sulphurets, per cubic foot of tailings from the Concentrator, was about one-tenth of an ounce. Second, the loss of sulphurets from the blankets was nearly *fifteen times greater* than that from the Concentrator. The Concentrator has not been found at any time in the slightest manner out of order, and has required scarcely any attention. Congratulating you upon the these facts, I am, sir, very respectfully yours, FRED. LAW OSNEAN, Manager Mariposa Company.

Notes of test run of Hunter's Concentrator—It having been supplied during the test with the sands reduced by one battery of the Princeton Mill, in the condition in which they are usually received by the blankets:—

Running time	1¾ days.
Amalgam saved on the plates of the Separator during above time, value	$6 75
Rate of saving of single machine per day	3 86
Rate of saving of six machines per day	23 16
Yield of Sulphurets, 1¾ days, pounds	215
Yield of Sulphurets, one days run of one Machine	123
Rate per day of saving from six machines, being the whole number required for the Princeton Mill	738
Yield of amalgam from plates of Separator, per ton of rock crushed, value	55
Yield of sulphurets from Separator per ton of rock crushed, pounds	18

HANNIBAL WILLIAMS, Superintendent Princeton Mill.

SAN FRANCISCO, DEC. 18, 1864.

I have recently examined one of Hunter's Concentrators and Amalgamators, in operation at the Princeton Mill, Mariposa Estate, the sand and crushed rock, flowing from one battery of four stamps, passing directly over the machine, without using blankets. On examination, it shows conclusively that the loss of sulphurets by the machine is much less than by the blankets, being but a mere fraction of the sulphurets, consisting of the light and thin scales, such as can scarcely be saved by panning; while on the other hand the tailings from the blankets contain a large amount of heavy sulphurets. The product of the machine is almost pure, clean sulphurets—the copper plates of the machine, being amalgamated, securing much or all of the free gold that escapes the battery. I witnessed the cleaning up of the machine, and the collection of a ball of amalgam. From the weights taken we may state the constitution of this ore, as it came from the batteries at that time, as follows:

Clean Sulphurets containing free gold and amalgam	18.00
Quartz sand, waste	1981.78
Loss of Sulphurets and tailings	.22
Total	2000.00

WM. P. BLAKE, Professor of Mineralogy, Geology and Mining, Mining and Agricultural College, California.

Hunter's Machine was Illustrated in the Mining and Scientific Press of December 24th, 1864. 3v10

Hansbrow's MINING PUMP.

Six-Inch Cylinder—Eighteen-Inch Stroke—Four-Inch Suction—Three-Inch Discharge—Capable of Forcing Two Hundred Feet high with ease: Also—

HANSBROW'S FIVE-INCH DOUBLE CYLINDER,

A Powerful Hand Pump, throwing a two and a half inch stream; Also—

Hansbrow's Deep Well and Windmill Pump.

All Sizes for sale by

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Grinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water, or Steam Power. For further information address W. W. HANSCOM.

1 Golden State Iron Works, San Francisco.

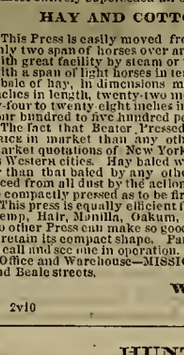
Pacific BEATER PRESS Company.

SAN FRANCISCO, CALIFORNIA.

This Company are prepared to manufacture and sell the celebrated PORTABLE BEATER PRESS, so well known in the East, where it has, in the short space of two years, almost entirely superseded all other

HAY AND COTTON PRESSES.

This Press is easily moved from place to place, requiring only two span of horses over any ordinary road; is worked with great facility by steam or water power; and two men with a span of light horses in ten minutes time will turn out a bale of hay, in dimensions measuring three feet eleven inches in length, twenty-two inches width, and from twenty-four to twenty-eight inches in depth, and weighing from four hundred to five hundred pounds.



The fact that Beater Pressed hay commands a BETTER PRICE in market than any other, is substantiated by the market quotations of New York and other Atlantic as well as Western cities. Hay baled with this press is much cleaner than that baled by any other in use, being completely freed from all dust by the action of the beater, besides being so compactly pressed as to be fire and water proof.

This press is equally efficient for Cotton, Wool, Palm, Tow, Hemp, Hair, Manilla, Oakum, Hops, Rags, Shavings, &c. No other Press can make so good a bale of cotton, and make it retain its compact shape. Parties interested are invited to call and see one in operation.

Office and Warehouse—MISSION STREET, between Main and Beale streets.

W. H. MITCHELL,
2v10 **General Agent.**

HUNT'S IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

E. O. HUNT,

No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

ATWOOD'S Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

DUNBAR'S PATENT SELF-ADJUSTING Piston-Packing.

Requires no Springs or Screws; Is always Steam Tight, without excessive friction, and never gets slack or leaky.

IT WILL SAVE EACH SEASON MANY TIMES ITS COST in friction, time, steam and power. No engine, old or new, should be without it. It can be easily fitted to old or new Pistons.

Having obtained the Agency of this VALUABLE IMPROVEMENT, I am prepared to furnish it wherever desired. For further information, address HENRY S. SMITH,

23v8 Golden State Iron Works, San Francisco.

HUNT'S NEW DITCHER.

HAVING SECURED FROM THE INVENTOR THE SOLE right to manufacture these Machines for the States of California and Oregon, and the Territory of Washington, I am now prepared to receive and promptly fill orders for these machines.

With the aid of three men and four horses this Machine will cut a ditch from two to three feet deep, as may be desired, dumping the earth all on one side so as to form a dike or embankment. For particulars send for circular, to

THE NOVELTY.

This ROTARY CYLINDER GRINDER & AMALGAMATOR *did not receive* the premium at the Industrial Exhibition. The one there displayed worked one hundred pounds at a charge, and was classed merely as a model, honorable mention of which being made by the committee. The inventor is now manufacturing some of the larger size of this machine, capable of working Two Thousand Pounds at a charge, and requiring no more power than is necessary for the pans now in use working but one-third that amount. This machine is simple in construction, durable and compact, very easy to clean up, and, in fact, is a perfect machine.

In offering his Amalgamator to the mining public the Inventor does not claim to have found the "Philosopher's Stone," nor any new method of extracting the precious metals from the ores, but does claim, as a practical mechanic and worker of milling machinery, that there was room for improvement in that direction, and that he has, by careful study, invented his improved ROTARY CYLINDER GRINDER AND AMALGAMATOR, known as the "NOVELTY," which mechanically overcomes the many difficulties that have heretofore arisen in the art of amalgamating ores.

This invention consists of a cylindrical-shaped case placed horizontally on legs, and provided with dies one and a half inches thick, making seventeen square feet of grinding surface, and having a rotary oblique muller (one or more) placed within it, and covered with shoes one and a half inches thick, and so constructed that all particles of rock must pass between the shoes and dies, causing it to be thoroughly reduced. The process of amalgamation is similar to that of the German Barrel, but much more rapid than that or any other amalgamator, as the muller gives three distinct motions to the pulp in one revolution. Heretofore, the chief objection to cylinder amalgamators has been the great wear and friction to which the journals were subject; but in this amalgamator that difficulty has been entirely overcome by the use of an adjustable metallic box, a new invention, that acts for the double purpose of a metallic packing and a journal box, and works to perfection.

This machine, when seen working will convince any practical man of its superiority over all others, and the public in general, and Miners and Millmen in particular, are invited to call and examine these machines, now in operation at the Miners' Foundry, where they are now being manufactured. Address, Miners' Foundry, San Francisco, Cal.

H. L. HOPKINS,
1v10 Inventor and Patentee.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, none has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the **PACIFIC FOUNDRY,**

1v10 San Francisco.

SALMON'S PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

No.	Fine		No.	Fine
Assay	250	Assay	300	990
Assay	285	Assay for Czotman	941	980
Assay	286	Assay Water Rock	940	966
Assay	291	Assay Water Rock	950	998
Assay		St. Helena Ledge, W. D.		966

These, including a hundred other batches, were all worked to within fifteen per cents., and some to within ten per cent. of the assay. Parties interested will find it to their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,

To whom all orders should be addressed. 15

Hepburn & Peterson's AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. The fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. between 3d and 4th.

[Illustrated in the Mining and Scientific Press, April 9th, 864.] HEPBURN & PETERSON.

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. **B. FAUCHERY,** Engineer.

FARRAND'S Oscillating Amalgamator,

RECEIVED THE

ONLY PREMIUM

AWARDED FOR AMALGAMATORS

At the Recent Industrial Fair

OF THE

Mechanics' Institute of San Francisco.

Committee of Awards.

O. BELDEN,	W. T. GARRATT,	H. P. WAEHLE,
O. GORE,	GEO. J. JOHNSON,	C. M. RADCLIFF.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

W. D. FARRAND, Inventor,

R. L. OGDEN, Agent, SAN FRANCISCO.

S. E. corner Montgomery and California streets.

19v9

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Sicen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15-1m

PRATER'S PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.

San Francisco, April 1st, 1864. 14v8-tf

Disney's Cylinder Amalgamator.

The Cheapest and Best.

DISNEY'S CYLINDER AMALGAMATOR, WHICH HAS recently been introduced to the public, has already been proved a complete success, and can be furnished, at a price cheaper than any other in use. It is simple in construction, and so arranged as to do a large amount of work with the smallest expenditure of power. The proprietor is satisfied that he can do more work in a given time and with a given expenditure of power than any other amalgamator in use. For small companies who desire cheap yet effective machines, none can be more desirable.

It may be seen in operation at the Rail Road Foundry on Fremont street where

A NEW CRUSHER

Is in operation and he can crush and Amalgamate at the LOWEST RATES. Miners and all others interested are invited to call and examine for themselves.

M. DISNEY, Patentee.

Black Hawk Mining Company, Chimhewawo
District, San Diego County, California.

Notice.—At a Meeting of the Board of Trustees of the above Company, held this 23d day of January, 1865, it was voted that all assessments levied previous to this date, and covering assessments Nos. 1 & 2, be and are hereby declared null and void. All Stockholders having paid said assessments, or any portion thereof, will be credited respectively with the amount so paid, upon the next assessment levied by order of the Board. HENRY HALE, Secretary.

San Francisco, Jan. 23, 1865. 4-t

Black Hawk Mining Company, Chimhewawo
District, San Diego County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 23d day of January, 1865, an assessment of forty cents per share was levied upon the capital stock of said company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, Room 5, No. 424 Battery street, cor. Washington.

Any Stock upon which said Assessment shall remain unpaid on Saturday, the 25th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 11th day of March, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale.

Any Stockholders having paid assessments Nos. 1 & 2, or any portion thereof, will be credited the amount so paid on the above assessment. By order of the Board of Trustees.

HENRY HALE, Secretary.

Office, Room 5, No. 424 Battery street, corner Washington, San Francisco, Jan. 23, 1865. ja28-4-4

And in accordance with law, and an order of the Board of Trustees, made on the 12th day of December, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the company, No. 430 Montgomery street, San Francisco, California, on the 4th day of February, 1865, at the hour of 3 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. WARREN CLARK, Secretary.

Office, Room 5, third floor, No 430 Montgomery street, San

Great Western Tunnel and Mining Company,

Aurora, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 5th day of January, 1865, an assesment of twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assesment shall remain unpaid on Saturday, the 4th day of February, will be advertised as delinquent, and unless payment shall be made before, will be sold on Monday, the 20th day of February, 1865, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

JOS. C. FORD, Secretary,

Office, No. 21 Exchange Building, corner of Washington and Montgomery streets, San Francisco. jauf-1-4

George Washington Gold and Silver Mining

Company, Silver Mountain District, California.

And in accordance with law, and an order of the Board of Trustees, made on the 12th day of December, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at the office of the company, No. 430 Montgomery street, San Francisco, California, on the 4th day of February, 1865, at the hour of 3 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

J. WARREN CLARK, Secretary.

Office, Room 5, third floor, No. 430 Montgomery street, San Francisco, California. 3

Henry Clay Silver Mining Company, Reese

River Mining District, Lander County, Nevada.

Notice is hereby given that there will be a meeting of the Stockholders, of the above Company, at the office of the Secretary, on the 18th day of February, 1865, at one o'clock P. M., for the purpose of electing Trustees, and for such other business as may come before the meeting.

J. E. PURDY, Secretary.

Office, Room No. 7, N. W. corner Front and Clay streets, San Francisco. 3

Kelsey Gold and Silver Mining Company,

Kelsey District, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 9th day of January, 1865, an assessment of fifteen cents per share was levied upon the capital stock of said Company, payable on the 10th day of January, 1865, in United States gold and silver coin, to the Secretary, at his office, in the city of San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday the 11th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday the 27th day of February, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

S. C. GARDNER, Secretary.

Office, No. 8 Express Building, corner of California and Montgomery streets, San Francisco. ja14-2-3.

La Paz Town Association, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 17th day of January, 1865, an assessment of fifty cents per share was levied upon the Capital Stock of said Company, payable on the 17th day of January, 1865, in United States gold and silver coin, to the Secretary, at the office of the company.

Any stock upon which said assessment shall remain unpaid on the Saturday the 18th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Tuesday, the 7th day day of March, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

B. W. MUDGE, Secretary.

Office, No. 528 Clay street, San Francisco, Cal. ja21-3-4

La Libertad Gold and Silver Mining Company,

Cuenchillas District, Lower California.

Notice.—There are delinquent, upon the following described stock on account of assessment levied on the 13th day of December, 1864, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
E Van Valkenborg	120	50	$7 50
E Van Valkenberg	121	70	17 50
John H Wood	126	5	1 25
John H Wood	127	5	1 25
John H Wood	128	3	75
Peter Blouia	130	10	2 50

And in accordance with law and an order of the Board of Trustees, made on the 13th day of Dedember, 1864, so many shares of each parcel of said stock as may be necesary, will be sold, at the salesroom of Edwards, Olney & Co., No. 626 Montgomery street, San Francisco, on the 28th day of January, 1865, at the hour of 12 o'clock M., of said day to pay said delinquent Assessment thereon, together with costs of advertising and expenses of sale.

WILLIAM VALE, Secretary.

Office, No. 36 Exchange Building, N. W. corner of Montgomery and Washington streets, San Francisco.

Louisiana Silver Mining Company, Reese Riv-

er Mining District, Lander County, Nevada.

Notice is hereby given that there will be a meeting of the Stockholders of the above Company, at the office of the Secretary, on the 18th day of February, 1865, at one o'clock P. M., for the purpose of electing Trustees, and for such other business as may come before the meeting.

J. E. PURDY, Secretary.

Office, Room No. 7, N. W. corner Front and Clay streets, San Francisco. 3

Morning Star Gold and Silver Mining Compa-

ny, Echo District, Humboldt County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 29th day of December, 1864, an assessment of one dollar and twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to J. W. Shanklin, Secretary and Treasurer, at the office of the Company, No. 625 Merchant street, U. S. Land Office Building, San Francisco.

This assessment is made subject to such credit for the stockholders as may have been allowed them on any payments of assessments, or expenses of incorporation, and the filing of the necessary vouchers on the same.

Any stock upon which said assessment shall remain unpaid on Saturday, the 25th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 17th day of March, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. W. SHANKLIN, Secretary.

Office, No. 625 Merchant street, San Francisco. 3-4

Mammoth Gold and Silver Mining Company,

Silver Mountain District, California.

And in accordance with law, and an order of the Board of Trustees made on the 9th day of January, 1865, so many shares of each parcel of said stock as may be necessary will be sold at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on Monday, the 6th day of February, 1865, at the hour of 12 o'clock M., of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of the sale.

3-v10 T. L. BIBBINS, Secretary.

Tuscoran Mining Company, Reese River Mining District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 12th day of November, 1864, an Assessment of 50 cents per share was levied on the Capital Stock of said Company, payable on the 13th day of November, 1864, in United States gold coin to the Secretary, at the office of the Company, No. 311 Commercial street.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 4th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday the 18th day of February, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

B. B. FORESTER, Secretary.

Office, No. 311 Commercial street (two doors above Front) San Francisco. Jan7-1-4

United States Mining Company, Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 20th day of January, 1865, an assessment of one dollar per share was levied upon the Capital Stock of said company, payable on the 21st day of January, 1865, in United States gold and silver coin, to the Secretary, or to JAS. V. COFFEY, at Virginia.

Any stock upon which said assessment shall remain unpaid on Saturday, the 25th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 11th day of March, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of tha sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, Nos. 8 & 10 Government House, corner Washington and Sansome Streets, San Francisco, Cal. ja21-24

Wilson Copper Mining Company, Garden Bar District, Placer County, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 19th day of December, 1864, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Ing, A D	17	50	$25 00
Odiet, Thos	112	100	50 00
Wetherbee, H	96	130	65 00
Wetherbee, H	106	50	25 00
Wetherbee, H	110	30	15 00

And in accordance with law and an order of the Board of Trustees, made on the 19th day of December, 1864, so many shares of each parcel of said stock as may be necessary, will be sold, at the Company's office, No. 511 Clay street, Room No. 8, San Francisco, on the 4th day of February, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

W. L. KIRBY, Secretary.

Office, Room 8, No. 611 Clay street, San Francisco. 3-v10

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the MINING AND SCIENTIFIC PRESS. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe o be a sensible motto.

Published by H. H. BANCROFT & CO.

New Mining Advertisements.

Scottie Gold and Silver Mining Company, La Paz District, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 25th day of January, 1865, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable on the 25th day of January, 1865, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 528 Clay street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the 25th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 13th day of March, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

B. W. MUDGE, Secretary.

Office, No. 528 Clay street, San Francisco. ja25-4-3

Salamander Gold and Silver Mining Company, Mill Valley District, Calaveras County, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 29th day of December, 1864, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
John Bly	193	10	$ 30
Thos Donohoue	96 to 101	85 5 19	2 55
M C Farley	235	10	30
X Huber	123 to 125	105 5-19	3 15

TO MINE OWNERS.

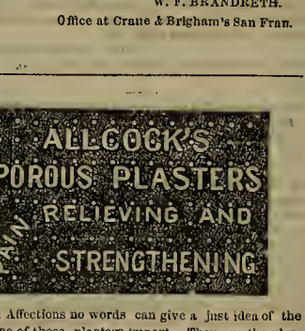
REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Address J. MOSHEIMER,



Office, Nos. 14 & 15 Mead's Building, Corner of Pine and Montgomery Streets, San Francisco. 9v23tf6

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat, pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

[The mining community begin to appreciate our reasonable rates of advertising, and are turning their patronage to the journal most properly entitled to receive it. The advantage to shareholders of having all mining notices concentrated in one mining journal, is obvious to all, and our terms have been established with a view to effect such a consolidation; and most companies having an object for publishing in any other particular paper, can consequently afford to have their notices appear in our journal also.—Eds. Press.]

BRUCKNER'S FURNACE FOR ROASTING SULPHURETS.

One of the most important problems connected with a thorough and economical working of both gold and silver ores on the Pacific coast, is that presented in the great cost and difficulty of separating those precious metals from their combinations with sulphur, in the condition of sulphurets. The solution of this problem, as applied to mining in other countries, has occupied the attention of scientific men for the past century. The philosophy of the process is now pretty well understood, but the slowness and great expense attendant upon it, is still acknowledged as a serious drawback; so much so that even in the cheap labor countries of Europe, various devices have been attempted by which to supplant the ordinary reverberating hearth by some more rapid and less labor-requiring apparatus.

Among other efforts, a "revolving hearth or disk has been devised, by which different portions of the hearth were brought beneath the action of the flame at such frequent intervals as to keep up the moderate degree of heat required, secure the free access of air and affect the necessary stirring of the mass, so absolutely necessary to a thorough roasting. All this was done by machinery; but still the contrivance, for some reason or other, would not work. Rotary cylinders have also been attempted, and abandoned, under what precise form and arrangement we are not advised.

Of late, Mr. William Bruckner, of this city, has been devoting much time and attention to this matter. Being thoroughly posted with regard to both theory and practice of metallurgy, he has been able to take hold of the matter with a skilful hand and matured intellect. The result of his researches and experiments has been the production of the apparatus, to which we alluded at considerable length last week, and which we further present, with an illustration annexed, in our present issue.

A *sectional* view in connection with the one given would greatly facilitate our effort to give the reader an intelligent idea of the working of the apparatus; but, in its absence, we will do the best we can.

The apparatus consists of an iron cylinder placed, horizontally, between two stacks of brick work. This cylinder is open to the interior of the brick work at both ends, and is supported by the chains attached to the pulleys above, and also by four anti-friction rollers, the two front ones of which will be noticed in the engraving, as secured to the supporting frame work. The furnace door is upon the further side of the brick work, as presented in the engraving, and upon the opposite end of the cylinder from that supporting the smoke-stack. The flames from the furnace must consequently pass *through* the cylinder on their way to the mouth of the smoke-stack, thus keeping up the necessary amount of heat for properly roasting. The chains are also used as belts to cause a slow revolution of the cylinder, in order to provide the necessary "stirring" of the ore, by which the particles are brought in contact with the oxydizing influences of the heated atmosphere of the furnace, by means hereafter described.

In order to prevent the destruction of the cylinder from the attacks of the sulphur in the ores, its interior surface is lined with fire-brick, made of suitable shape. A screw-shaped projection or riffle, of fire-brick, is attached to the inner surface, commencing at either end of the cylinder and passing spirally around until it reaches from either direction to the man-hole used for charging and discharging the cylinder. The effect of this riffle is to produce the proper distribution and stirring of the ore. We have seen this furnace in operation, at 416 Market street, in this city. It appears to work well, and the inventor assures us he meets with no trouble from any caking of the mass. He has had it in operation at intervals for the past month, during which time he has worked five or six charges, as he could obtain the ore. The mass worked has been black sulphurets, containing galena, zinc blend, copper pyrites, and quartz—a silver ore. The roasting was quite as well as it could have been done on the ordinary hearth; while the saving of time and labor, with a suitable number of furnaces in operation, must affect a vast economy over that expended on the ordinary reverberating furnace. Mr. B. is now prepared to work for any parties who may have ores or sulphurets which they desire to subject to such a process, affording, at the same time, ample opportunities for all who may desire to witness the working of the furnace. This furnace may be employed to equal advantage in roasting copper and lead ores for smelting, or auriferous sulphurets for chloration or any amalgamating process.

The Harrison Steam Boiler, an American invention which is now attracting much attention in the Eastern States and Europe, will soon be put to a practical trial in this city. Mr. E. T. Stein, of the Novelty Iron Works, on Fremont street, is now putting up one of these boilers at his works as above. It will soon be ready for "firing up," of which due notice will be given. We have alluded several times to the success which has attended this novel steam generator at the East, and shall give a full description of it as soon as Mr. Steen gets the one he is now at work upon into full operation. Mr. Steen is agent for the patentee on the Pacific coast.

The San Jose Courier is the name of a fine new daily recently started in our neighboring city by Messrs. Yates, Tiffany & Byerly. They are young men of enterprise, whom we wish success.

Rich Silver Ore.—We were shown a very rich specimen of silver ore, a few days since, from the "La Libertad" silver mine, located in the Cacachillas District, Lower California and distant some six miles from Ventana Bay and sixteen miles from La Paz. This mine was purchased about two years ago by Col. Leese, from a Mexican who had taken from the croppings upwards of $90,000. A company was formed in this city about eighteen months ago, to work the claim which consists of 2622 feet. A tunnel has been cut at right angles to the main lode, on the water level, 200 feet in length, with a good air shaft. A spur of excellent ore has been struck in the tunnel about twenty feet from the main lead, from which the specimen above alluded to was taken as a sample, and which, assayed by Messrs. Riehn & Hemme, was found to contain at the rate of $3,961.77 in silver, and $43.32 in gold or $4,005.54 to the ton of 2,000 pounds. The specimen, until after the assay, was not considered of extraordinary richness, being taken as a mere average specimen of the vein. As the Mexican law allows rough metal to be exported from Lower California, the product of this mine can all be forwarded to Swansea at a small expense, and if the main lead is of the same character as the spur in the tunnel, the La Libertad will be one of the richest mines in the world. The affairs of the Company, which was incorporated in July last, are managed by Messrs. J. Dean, Samuel Pillsbury, H. L. Chamberlain and B. C. Howard; French W. Vale is the Secretary, office at No. 36 Exchange Building, in this city.

Mexican Sea Island Cotton Company, is the title of a corporation which has recently been organized in this city, for raising a superior quality of cotton, known as the Sea Island variety. The company has secured several thousand acres of land adapted to this peculiar cotton, on the bay of Teacapan, in Sinaloa, Mexico. The location is said to be most desirable and convenient for both cultivation and transportation to market of the bulky produce. The services of an experienced cotton planter have been secured to manage the plantation. The managers are, Col. T. N. Casneau, J. C. Duncan, H. P. Jones, William Langerman, and Jabob Schreiber. Wm. L. Duncan, the Secretary, may be found at 605 Montgomery street. The method of operation is to raise a cultivation fund of $40,000, to be collected by the issuance of 3,000 share, 2,500 of which will be at sixteen dollars each, payable in sixteen installment of one dollar per share; commencing by the payment of a deposit of one dollar a share, the second installment of one dollar on the 15th of February, 1865, and continuing the monthly installments of one dollar for fifteen months, until the 1st of April, 1866, which embraces the time occupied in preparing the land, cultivating and harvesting the crop. Beyond the ment of the above installments, the shares unassessable.

"Gun Boat Cars" is the la for defence, in the Western ment. They are iron-clad— —and placed in the middl

Metallurgy of Copper in California.

[By Paul D'Heirry, M. D., Mining Engineer, Professor of Chemistry and Metallurgy, Superintendent of the Copper Mining and Smelting Company, Queen of Bronze, Oregon.]

NUMBER TWO.

PRELIMINARY OBSERVATIONS.

Before erecting works of reduction, it is necessary to examine with care if the things requisite for the business correspond to the object proposed.

We must renounce the idea of establishing foundries in places where fuel is scarce and dear. We must recollect that fuel, even at a low price, is one of the most costly articles used in the reduction of metals. We must recollect that the coal of California and of the neighboring States, is not fit for any metallurgic operations, and that the coke which comes from the manufacture of gas is of too high a price, and is not sufficiently abundant, to be used with advantage. We are then confined to the use of charcoal; this being so, it follows that a foundry can only be established in a wooded district. If the ores and the wood are not found in the same place, it will be necessary to ascertain which of the two will cost the least to transport, and the location of the works will be chosen accordingly. It is necessary, as much as possible, to avoid transportation, which in this country is dear, and requires labor which is too expensive when we deal in inferior metals.

We must not think of erecting works of reduction for a mine of which the ores are too impure, that is to say, whose ores contain much arsenic, antimony, phosphorus and lead; such ores give only bad copper, and cannot be worked except by being mixed with pure ores. In such cases, it will be necessary to be able to procure from other mines these pure ores, and to take into account the price of their purchase and transportation in the estimate of the expenses. We insist strongly on this recommendation which is of a vital importance to the success of the enterprise.

They work in Europe ores containing one or one and a half per cent. of copper. Here it would be impossible—very poor ores could not be made profitable in California, for the present, on account of the high price of every thing. It should be understood that a ton of ore yielding twenty per cent. and another which yields ten per cent. cost alike to reduce, at least so far as regards the extraction and the first operations of smelting; and the ton yielding ten per cent. gives but the half of the benefit of the other, after having required a general expense almost equal. But, it will be demanded, what is the lowest rate of value at which one can work copper ore here? In reply to this question it would be necessary to have the ore under our eyes and to know its ingredients. Nevertheless, we believe that in an establishment well organized, we could advantageously smelt at nine or ten per cent., provided that the veinstone be favorable to the formation of good slags, without the addition of too great a quantity of flux, or of one too costly.

Before establishing works of reduction, it is requisite that the mine be opened at several places, in order that they may be assured of a permanent supply of ore, for we must remember that a stoppage of the fires, for want of ore, would cause a considerable loss. We make this observation, so elementary in its nature, because we have observed that many persons have a very false idea of metallic veins. They seem to think that a vein once opened, should yield ores uniform or of nearly uniform richness. There is in this a great mistake. Nature does not work with this uniformity. A vein may narrow, may become very poor without ceasing on that account to be an excellent mine. It may even remain barren for some time, and become afterwards more productive than ever. It is for want of taking into account these irregularities, little alarming in themselves, that we see so often in our stockboards, and even in the mineral district where they should know better, the stockholders seized with sudden panics, and the stock of the unfortunate mine fall to nominal prices; then all of a sudden raise higher than ever.

There is not one of our good mines which has not given instances of this kind. It is on account of these accidents so common, and we may say, so inevitable in the best mines, that we recommend the opening of the veins in a great number of places, in order that a rich part may always supply for others momentarily impoverished.

Another thing to examine before the erection of furnaces, is the question of materials. We everywhere procure stone or brick that is not the difficulty; but it is necessary to line these furnaces with materials which resist fire. The linings of the furnaces are destroyed very quickly by the action of great heat and the reaction of the gases and matters in fusion. Fire bricks are very dear in San Francisco, and they are a very heavy, and consequently, costly material to transport, and add a large sum to the total of expenses at the end of the year, if we do not find a substitute for them.

In the first place, we find fire-clay in the interior. There has been found a fine vein of it four miles from the Queen of Bronze, which makes fire-bricks of the first quality by an operation which costs but little. In the absence of fire-bricks, there will be found stones which resist fire very well—silicious sandstones, many of the schists, the gneiss, and some granites. The best mode of testing the quality of these materials is the trial by fire.

Many experiments have been made within a few years, and are still being made in order to simplify the processes of reducing copper ores; but they have resulted only in depleting the treasuries of the companies which have adopted them. We cannot therefore, too cautiously guard the interested against expensive experiments. Not that we repel progress; not that we pretend that improvements cannot be made in this branch of metallurgy; but when it is a question of expense, like the erection of works of this kind, a check is ruin. We should adopt, therefore, only the processes sanctioned by experience, the efficacy and economy of which have been proved by repeated results; to act otherwise would be to compromise the interests and betray the confidence of those who furnish the funds.

As we will see hereafter, the processes for the reduction of copper are very complicated and very delicate, and require a long experience on the part of the smelters; also we believe we should recommend a great prudence in the choice of workmen. It is, in every case, indispensable to have in a smelting establishment one or two who are experts, to superintend and direct the others. We must not forget that for want of attention or of experience in the smelters, an establishment may suffer considerable losses and even come to a complete stoppage.

Already it has been shown by what process, and it will be more clearly seen hereafter, how indispensable it is to always know the proportion of copper, and the exact composition of the ores. We know that this proportion and this composition may be very variable in the same mine, and that the most practised eye is liable to make great errors in valuation. Besides operations so costly and so important as the reduction of metals, cannot depend on suppositions; the road should be plainly marked and should conduct straight to the end proposed, without hesitation and without groping. It is necessary, then, that a superintendent of a smelting establishment should not only be familiar with the operations which he is entrusted to manage, but he should also be able to make all the assays and quantitative analyses necessary to secure the safety of the operations.

All that we have said in this chapter will appear very trivial to experts, but what we have recently seen makes us feel the necessity of insisting on elementary matters; a man may be very distinguished, and a member of committees and boards, and yet have no notion of the mines in which fortune is involved. This has been proved superabundantly, and has not been the least among the causes of the disasters which have stricken mining enterprises.

[To be Continued.]

[Written for the Mining and Scientific Press.]

More about Calvert's Process.

Messrs. Editors:—As the subject of the use of Calvert's process for extracting gold has caused considerable discussion, for and against its practical value, it would perhaps not be amiss to show the disadvantage of the process, such as it appears to one who has had much practical acquaintance with the chloration of gold, by the similar process first introduced by Plattner.

It is not presumed that Professor Calvert—the same who wrote the nature of alloys, coking of coal, etc. [?]—ever calculated to use his process on concentrated, raw sulphurets, as he could not have been unaware of the great amount of chemicals necessary to work a ton of such raw ore. Any one practically acquainted with Plattner's process is aware of the great consumption of gas by the sulphides, and the impossibility of a good result on gold ore which has not been thoroughly roasted.

The writer observes that the objections to the process, by Mr. Rowlandson, appear to be entirely of a chemical nature. Mr. R. says the formation of sulphureted hydrogen, produced by the action of hydrochloric acid on sulphides, causes the precipitation of the gold, from its solution, *as a sulphide*, rendering it again insoluble.

Your correspondent "C. A." in replying to Mr. Rowlandson, takes exception to the statement, denying the formation of hydrochloric acid in presence of per-oxyd of manganese; and sulphureted hydrogen in presence of chlorine gas. Now Mr. Rowlandson is certainly correct when he insists on the formation of hydrochloric and hydro-sulphuric acid. Hydrochloric acid is always formed by chlorine gas, in the presence of steam or hot, damp ore. Plattner, himself, recognises this fact by washing the chlorine gas, generated from *dilute* sulphuric acid (one half water), for the very purpose of freeing it from hydrochloric acid, to avoid its reaction on imperfectly roasted sulphides, always present in roasted ore, as no absolute perfection in roasting can be expected; but Mr. Rowlandson is mistaken in supposing precipitation of the chloride to a sulphide of gold to be the cause of a failure of the process, as the sulphide of gold is easily converted into chloride of gold again, by an escape of free chloric gas. The fact that gold is precipitated by sulphureted hydrogen in the ore, after having been converted into chloride of gold, the writer has often experienced by a non-solution of, *sometimes*, one-third of the gold, while not a particle of metallic gold could be detected after filtering; while previously there was no difficulty in doing so—the sulphate of protoxide of iron, possibly present, was already transformed by chlorine in sulph. of oxyd of iron and chloride of iron, and could not have precipitated the gold as a black powder.

One of the principal points of success in chlorating gold consists in the presence of *strong chlorine gas*, or, less effectual, *strong chlorine water*, kept up by a liberal supply of acid, salt and manganese. Whenever this condition is not fulfilled no good result can be expected from any chloration process of gold ore—either Calvert's or Plattner's.

We notice from these facts that there can be no difficulty, *from the reasons given by* Mr. Rowlandson, in working quartz with a small amount of sulphurets, arseniurets, etc., by Calvert's process.

The difficulty of success by this process, however, lays in another direction, and that is the fact that the gold, coarse and alloyed with silver, as it occurs in our quartz ledges can not be but very slowly and tediously chlorated, even by a current of strong chlorine gas. A continual washing off of chloride of gold is absolutely required to effect it perfectly. Any one can convince himself of this fact by exposing particles of gold, such as we find in our quartz ledges, to the action of strong chlorine gas, and washing off the chloride of gold repeatedly. The tediousness of the operation will speak for itself.

The chloration will only succeed on fine gold, such as we find in sulphurets after the coarse gold has been extracted by amalgamation which extracts the gold from quartz, very close to the assay, a fact often contradicted by men who have not fully investigated the subject. The auriferous concentrated sulphurets generally yield from $30 to $200 to the ton, though sometimes they run much higher.

In conclusion, Mr. Editor, allow me to inform the public through the columns of the Press, that the chloration process *is not necessarily unhealthy*, when employed by those who thoroughly understand the subject. The writer knows men who have been working Plattner's process for the past six years, on a large scale, and who have not suffered at all from the effects of the gas; while one, at least, has actually grown fat in the business. Good, practical apparatus and skillful and intelligent manipulation is all that is required to prevent any unhealthy effects therefrom. Under such conditions the process can be carried on in a parlor with no more inconvenience than is experienced from a moderate use of chloride of lime.

"Rowlandson vs. Calvert."

Editors Press:—Your last number contained an article under the above caption, over the signature "C. A." I make it a rule never to enter into a controversy with an anonymous writer, and I should not have troubled you on the present occasion had it not been from a desire to make that fact known. When "C. A." elects to publish his opinion over his real name, I will fully reply to all his assumptions, fallacies and hypercritical remarks. "C. A." sets out with an assumption which I think deserving of notice, although it is one quite outside of the question in controversy. I allude to a charge that somewhat more than insinuated my paper was actuated by private pique or professional jealousy. To this I can most emphatically reply, that I do not personally know Professor Calvert, never corresponded with him, nor in any one way have our respective lines of occupation crossed each other, nor are they at all likely to do so. As an instance of the perfect candor with which I wish to treat that gentleman's reputation, I wish to state that I believe I was in error in stating, in my last, that no great economic improvement has hitherto been connected with Professor Calvert's name outside of those connected with the subjects which may be more particularly considered his *forte*.

The conversation held with Mr. B. at your office on Saturday last, respecting the desulphurization of coke for smelting purposes, recalls to my recollection the fact that salt had been recommended, and, I believe, pretended to produce that effect. To this application of salt I have seen favorable allusion made, and, if I recollect right, Professor Calvert was the inventor. If this is true, an apology is due to Professor C. for the omission, and I most willingly give it. The making such an apology, if due, as I believe it is, forms my second reason for forwarding this letter.

A word, however, to "C. A.," as it is apart from the issue between me and him. If "C. A." is a friend of Professor Calvert, let him in his next letter to the Professor, remind him of the Latin adage, "*ne sutor ultra crepidam.*" Metallurgy is certainly not the Professor's *forte*. Further, if "C. A." is desirous of learning *facts*, in place of adopting chemical formulæ, which tell against him, let him apply to a practical operator, like Mr. Deetkin, from whom he will ascertain that the assertions made by me, are based on the results of actual operations.

Thos. Rowlandson.

Sulphur Mine on Fire.—Early last week, says the Humboldt Register, some careless or malicious person set fire to the sulphur mine, about two miles below Humboldt City, and it made a stir among the natives and whites, for a time; but by lively exertion, the fire was smothered. The estimated destruction of sulphur is two or three tons. During the time of burning, it rolled out in a blue stream from the cut in the edge of the mine.

A tannery is in full operation in Nevada city, which, according to the *Transcript*, turns out leather of the finest quality sufficient to supply the home demand.

Report on the Buckeye Gold and Silver Mining Company.

BY W. BURGOYNE, M. E.

SAN FRANCISCO, Jan. 9th, 1865.

To the President of the Buckeye Gold and Silver Mining Company—

SIR:—In compliance with your request, I beg to submit for your information the following report of the Buckeye Gold and Silver Mines:

This Mine is situated in the Devil's Gate Mining District, State of Nevada, and located wit in three miles of Virginia City and Gold Hill, and within one mile of Silver City.

The situation of thesu works is of a most favorable character, having the new road recently made from Virginia City to Dayton, and also to Carson River, on the northwest about three chains from the principal works, and also, the main Pioneer Road, on the southeast, about one mile; each of these roads affording great facilities for carriage of all descr ption of material for the development of the Buckeye property.

After carefully surveying the geological facilities which are afforded to the mineral resources, my attention was called to the machinery erected on this mine, and it affords me much satisfaction to be able to certify to the substantiality and thorough adaptation of the plant erected thereon. The engine is forty horse power, which is now used for pumping and winding; there is also a good office and a substantial building for your superintendent, smith's shop, and other necessary buildings for the works.

UNDER GROUND NOTES.

I find the main shaft is sunk two hundred and eighty-seven feet below the surface, on the incline of the lode. I carefully examined the metallic vein or outcrop at the surface for some ten or twelve chains from the mouth of the shaft, and I find the appearances of the outcrop to be of the most productive character, the vein being principally composed of iron pyrites, felspar, and large masses of quartz, with every indication of making large deposits of the precious metal in depth. The stratification running parallel with this lode is such as is frequently found to accompany lodes or veins of a similar character, and I am pleased to say that it is very unusual to ever find a vein or lode passing through such a strata as this, to do otherwise than yield large deposits of mineral. This strata is composed principally of slate of a rather browaish appearance, some geologists might term it porphery, but such is not the case, it is principally quartzide, and chloride, and talcose slate; this strata is known to be most productive for gold and silver ore.

The lode that the shaft has been sunk on shows favorable appearances for gold, the same averaging from four to six feet wide; no work has been done in opening north or south on the continuation of the vein only at the depth of two hundred feet, and there I find you have drifted north and south, the distance south eighty feet, and to the north ninety feet. In each of these drifts the lode has been productive and has yielded large quantities of gold and silver rock. The lode in each of these drifts is of a most productive character, and its appearance most favorable for profitable results, the lode being from six to eight feet wide in many places; the geological appearance being a well formed and defined lode with two good walls, the angle of dip is 45° to the east, this is about the average dip of all the principal mines in the district, including Devil's Gate, Gold Hill, and Virginia.

I also find at the depth of two hundred and eighty feet there has been a level driven to the north thirty-five feet; the lode in this drift has much improved in appearance from the level above at two hundred feet, and I feel justified in remarking that the general formation of strata has much improved for the existence of gold and silver, the bearing rock is chiefly talcose slate, that is slate resembling soapstone, but which does not feel as greasy. This slate is red and ferruginous at surface, at a great depth it is filled with small crystals of iron pyrites, which are decomposed near the surface as peroxide of iron, which colors the slate brown, and in a few instances yellow. It is of various grades of hardness. In those places where the ground or earth has been exposed to more heat than elsewhere, it is a metamorphic rock, and runs in regular belts, which is a stratification known to be most productive of the precious metals. Indeed, it is the proper matrix for gold and silver. Wherever those metals are found in great abundance it will be in this formation, and I do not hesitate to say, after my careful examination of the lodes and geological formation of the Buckeye mining property, it has greatly increased its value by development in depth. The south drift at the two hundred and eighty feet level, has been driven thirty-two feet, in cutting through the lode or vein. The vein here is large and I fear not so rich as in many other parts of the mine, but of course this is only a supposition of my own, not having any means to analyze the ore; but I should further remark, if you and your company had crushing power sufficient to crush your own produce of rock from this point or south level, the lode would be worked at a large profit.

I find that you have two other shafts sunk on the course of the lode, and in each of these shafts the lode shows favorable. I should also remark that a shaft has been put down some eight or ten feet on the continuation of your lode, and which is in you mining property, by another party of mining speculators; and the lode or vein in the bottom of this shaft is from three to four feet wide, and is of the most congenial character, and I think I am justified in stating its undoubted value to be $100 to the ton as it was when I was on the mine. If necessary, I can give you my authority for the statement of value.

Before I conclude, perhaps you would allow me to offer a few remarks, as an old mining agent and metalologist, for upwards of twenty five years, in the largest mines yet worked. I should recommend you to sink your main shaft at least 150 feet deeper, as I am strongly impressed you will have valuable results from that operation, as the Buckeye lode is so favorably situated, geologically, that it will increase in its metallic substance and value in depth. You need not fear or doubt us to the profitable results of this mine if developed as it should be. I should also recommend you to drive the bottom levels north and south, as the appearance of each drift or level is such that will justify me in advising you to push operations with the utmost vigor.

I should further recommend you to erect a battery of stamping power, say at least from eight to ten stamps. This would enable you to return all your own ore, and save the enormous expense of the present price of crushing, and, perhaps, prevent losing one half of the bullion. Your engine is powerful enough to drive all the crushing requirements for many years to come, and enable the Buckeye Company to appear among the dividend-paying mines of Nevada, if systematically managed.

There is another important point I must call your attention to, and that is the same as I advise all companies, to have a superintendent who thoroughly understands mining. Not having such superintendents is the cause of the great destruction now hanging over our mining pursuits and enterprise.

QUANTITY OF ORE NOW AT SURFACE, OR WAS ON SURFACE AT TIME OF SURVEY:

First-class ore, forty tons, or thereabouts; second-class ore, from sixty to seventy tons. I should also remark that you have large quantities of ground now open in the Buckeye mine that will pay well for taking away. There are many hundred tons more now standing that will pay from twenty to twenty-five dollars per ton, and the cost of obtaining and crushing the quartz will not exceed twelve dollars per ton, if you had a mill of your own. I cannot see any reason why you should not do so. The engine above named is powerful enough for all purposes.

In conclusion, I beg to say you have as good a mining property as any company need to seek for, and one which could be made to pay a heavy profit forthwith by carrying out the propositions named above. I remain, your obedient servant,

W. BURGOYNE,
Metalologist and Mining Engineer.

HOW TO SMOKE.—The method of smoking makes all the difference in the world. Those who use the clean, long pipes of clay—as did our old Knickerbockers—feel only the effect, the gaseous bodies and free carbon. Wooden pipes and pipes with glass stems are injurious. Cigars should never be smoked to the end; otherwise they are more injurious than all. Dr. Richardson says they should be cast aside as soon as one-half is smoked, and always through a porous or absorbent tube. Pipes are much less hurtful than cigars. The best pipe is a long clay pipe; next to this, the meerschaum is the most wholesome. Dr. Richardson says the perfection will be found in a meerschaum bowl, an amber, mouth-piece, and a clay stem. All attempts to condense the oil have thus far failed. Every smoker should be careful of the manner in which he smokes. A short foul pipe is very unhealthy.

CORN BREAD.—One quart of milk, three eggs, half cup of sugar or molasses, teaspoonful of saleratus, cup of wheat flour. Thicken with Indian meal to a batter. Bake in flat pans.

TO PICKLE FRUIT—Seven lbs. of sugar to ten lbs. of fruit, one pint of vinegar, scald them three times, letting them stand and get cold every time; spice to your taste.

DOUGHNUTS.—One quart of milk, three eggs one and a quarter lbs. of sugar, three-fourths lbs. butter, ginger and nutmeg, small cup of yeast.

SOFT WAFFLES.—One quart of milk, four eggs, one-quarter pound of butter, yeast; to be made as thin as pancakes.

[Written for the Mining and Scientific Press.]

From our Journeying Correspondent.

JAMESTOWN, January 28th, 1865.

EDS. PRESS:—My last was dated from Chinese Camp, one week ago, but I had not, at the time, enjoyed any opportunity of observing the business, and other prospects of the place. There is no quartz mining in the immediate vicinity of the camp, and there is nothing doing in the placer mines there at present. The earth in which gold is found is a stiff clay which will not wash until it has been once thoroughly dried, when it slacks like lime, and parts with its precious ores very readily. In consequence of this, business of all kinds droops there in the winter. Like every other town in this portion of the State, it is suffering severely from the reaction of the copper-mining excitement of last year, in which everybody invested, and not having enough capital to carry their enterprises to a successful issue have lost heavily. The state of the public mind cannot be better described than by comparing it to that of an intoxicated man who is just becoming sober. In fact the reckless manner in which our people invest in any new speculation, and the gloomy feelings which many show when the speculation proves a failure, makes the parallel with intemperance too striking to be at all agreeable.

My stay at Chinese Camp in spite of the dulness of business, was made very agreeable by the polite attentions of Mr. Charles Cutting, post-master of the place, and of Capt. George Fisher, of the military company which is here organized, and last, though not least, by the good living at Taylor's Hotel.

Though I have been traveling on foot since leaving Knight's Ferry, yet I have had occasion to note the regularity, promptness, and politeness of the employees of the company who own the stage lines on this route.

I arrived at this place (Jamestown) late Thursday evening, in the rain, and, as it has been raining nearly ever since, I have had little opportunity of making observations.

The principal interest of this place is quartz mining, which is quite prosperous. The town presents a better appearance for business than any I have seen, there being more appearent life and confidence among the people, and more genuine Yankee enterprise, and consequent success. I have visited some of the principal claims, at the head of which stands that of Messrs. John App & Co., which is most skillfully and profitably worked. They have a ten-stamp mill, and are preparing to use one of Varney's amalgamators for saving the sulphurets, which are very rich, but are difficult to reduce. The largest owners in this mine, Mr. App and Mr. Detwiler, are polite and intelligent gentlemen, who regard mining as a science rather than a speculation, and make it a subject of thought and study. In strong contrast with this prosperous and enterprising company, is one owning a claim immediately adjoining, on the same ledge, and whose rock assays quite as much to the ton as that of App & Co., and is every way similar, but which does not pay much over expenses. The superintendent of this mine, a sturdy old Norwegian, in a conversation about "mining papers," made this remark: "O, yes, dey ish ver' useful, ev'ry time a man supscribe dat ish five dollars in de publisher's pockets." This *argument* was undeniable, and *to him* sufficient reason why "te Frishco scamps" should like to publish one.

It is cool this evening, with a prospect of clear weather, and I hope next week to be able to extend my field of observation and labor.

D.

HARD-TIMES GINGERBREAD.—Two cups of molasses, one cup of sugar, three parts of a cup of butter, or sweet dripping, a coffee cup of water, a tea-spoonful of saleratus, a table-spoonful of ginger. Knead soft; roll half inch thick; bake quick.

THE RAIN FALL up to Feb 1st has been 21.08 inches, within a fraction of an inch of the usual average for an entire season.

ORES FROM MEXICO.—Nineteen tons of first class ores were received by last steamer, from the La Favorita Mine, Sonora.

On Public Speaking.

On the 6th of December Professor Blackie delivered a lecture on "Public Speaking," in connection with the Free St. John's Young Men's Association, Edinburgh.

Professor Blackie, in the course of a very humorous lecture, remarked that man being a ransonable being was therefore a speaking animal. It was as natural for man to speak as it was for a bird to sing or a dog to bark. Certain rules were required with regard to public speaking. The first rule was—Never to speak without having something to say—something solid and sensible. A man ought not to speak for the purpose of making a display; or, as it was commonly termed, an exhibition of himself. A shallow talking fellow was generally an object of contempt in the world, especially the Scotch world; but that fellow was the worst who could not speak at all. A man never ought to speak without having thought out what he was going to say. The second rule was—Never say anything except at a proper time and in the proper place. The third was to remember that the end of public speaking was not to pour out your own feelings, but to try to touch the feelings of others, and to cause the heart-strings of others to be in harmony with your own; and to achieve this it was necessary to have a large share of sympathy and love. A man to get through the world successfully ought to learn to be a good orator. The business of a man was to think for himself. He did not mean by that that a man should magnify himself in public or in private, but still he ought to be able to express his own opinions clearly on every subject. Nervousness and timidity were a great drawback to public speaking, and he urged upon his hearers to avoid them as far as they could. It was a very foolish thing to be afraid of a fellow-being, no matter whether there were a dozen or a hundred of them. In addressing an audience the speaker had a right to suppose that his hearers were ignorant of the subject on which he was addressing them, because if he was an honest man he would not dare to stand up to address them without having first studied his subject for perhaps weeks, months, or years. Other persons there were who allowed what they called modesty to interfere with their oratory. He thought there was a good deal of pride and conceit mixed up with it. ("Hear, hear.") Man ought to possess sufficient confidence to be able to speak in public. Then came the point, How were they to acquire a proper command of language? A large intercourse with men and books would give a man words. Other essentials were to mix with all classes of people, read all kinds of books, and learn every language. Writing a great deal too was very necessary, both in prose and verse. Trying to write verse would give color and beauty to the prose. The best example of this was Hugh Miller. Writing gave elevation of style, accuracy in expression, and taught them to join their sentences and to pack their clauses well together. To make good sentences a person must write a great deal. No man could call himself a speaker until he could *extempore*, and he would be greatly assisted in acquiring that power by writing a great deal at home. To speak well the English language ought to be throughly studied; it was the most difficult of all languages, and required a deal of attention. The next point was to know how to keep the thoughts in order. To do this they must get rid of the paper, which was so commonly in use among the preachers of the Church of England. When a man knew a subject well, the paper before him was a thorough hindrance. A man, if he were addressing his sweetheart, would not speak from a paper, and therefore they should learn to speak fluently and without paper first, and then as well and sensibly as they could. That was Lord Brougham's advice, and it was correct. A small piece of paper on which was written the principal heads of the subject, and also the "catch"-words were also great helps to public speaking. Another feature to acquire power of language was to write out well the whole of the discourse beforehand, by which means they would be able to speak more accurately and chastely when they came before an audience. In conclusion the talented lecturer said that to be a speaker natural gifts were required, coupled with a proper training, and young men who aimed to be orators should bear in mind these things.

POTATO YEAST does not keep long, but it is very nice to use for anything which requires raising. It is made by smoothly mashing a dozen large, mealy, boiled potatoes, into which mix a large handful of white flour and a little salt. Stir in a tea-cup of baker's yeast to make it a batter. When it is raised up light, bottle and cork it tight, and put it in a cool place. It may be used without any fear of making bread or biscuit bitter, as is sometimes the case with hop yeast.

IT is asserted that the Emperor has nominated Prince Napoleon as Regent of the Fr[illegible] the Empire, in the even of his death.

A $15,000 statue of the late Dr. [illegible]h very to be placed in Central Park, N[illegible]understood, plain.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, FEB. 4, 1865.

The demand for money is light. The market is well supplied with available means, and a greater accumulation of idle capital may be noted. It seems to be conceded now, by many of our bankers and business men, that rates of interest are likely to be materially reduced during the current year by the increasing competition of money lenders. Receipts of bullion since last Saturday amounted to $850,000. Gold bars were higher yesterday than for several months past, and commanded 880@890. Silver bars were sought for at from ½ to 2 ℔ cent. premium.

The share market continues to gather strength, and some leading stocks have been sold at better prices. The list of dividend-paying mines is increasing, and there are others which have hitherto been a burden to stockholders, and are not yet dividing profits, but have reached a degree of productiveness that pays expenses and provides the means for future improvement. With scarce an exception, all the claims on the Comstock are doing well, and even some whose reputation, not long since, was partially eclipsed, are again challenging public favor with new evidences of value. City stocks are attracting more attention, and have also advanced.

Spring Valley Water Co. has steadily advanced to 93 ℔ cent. bid on amount paid in ($460 per share), without eliciting sellers. San Francisco City Water Co. is inquired for at 70 ℔ cent. of par ($500). At these rates, the aggregate market value of the stock of the two companies is about $2,700,000, and the shares of the new incorporation (6,000, at $100 each,) would be worth just 45 ℔ cent. of par, or $45 per share. Fully this amount has been actually expended by the two companies, and the future net earnings of the Spring Valley Water Company are likely to warrant the payment of regular dividends. California Steam Navigation Co. rose from 79 to 80, which latter is now bid. San Francisco Gas Co. is inquired for at 81, and State Telegraph at 33. California State Bonds have advanced to 78 bid, and Sacramento county 6's to 41 bid.

Legal Tender Notes have been actively dealt in, and $197,000 were sold, steadily advancing from 47¾ to 49¼, seller 30, and 49⅞, seller 4, and closing at 49¾ bid, 50 asked. The latest telegraphic advices from the East quote gold at about 200.

Savage advanced from $1,625 to $1,650, receded to $1,630, and was held at the close at $1,640, at which rates 13 feet were sold. After the payment of a dividend of $75 per foot for the past month, a large surplus will remain in the treasury of the company. In the fourth or lower working level of this mine (at a depth of 365 feet), the lode has attained a width of 110 feet, in nearly every portion of which pay ore is found. A drift is now under way, at a depth of 80 feet from this level, to communicate with the engine shaft, and new galleries are soon to be opened 445 feet from the surface. At this point a body of fine ore has been disclosed, which is likely to prove as valuable as that met with above. The product of the mine for the month of January averaged some 200 tons of ore per day.

Gould & Curry has been very inactive, and only 6 feet were sold, advancing from $1,515 to $1,560, and closing at about $1,560. A dividend of $75 per foot has been declared for the month of January.

Yellow Jacket attracted more attention this week and was very actively dealt in; 88 feet changed hands, advancing steadily from $900 to $1,045, and closing yesterday at $1,050, s. 30. Important developments have been made in this mine recently. A large deposit of splendid ore has been met with, equal it is said to anything yet found on the Comstock. The net earnings of the current month will, it is thought, cancel all the obligations of the company and enable them to accumulate a fund for the dividend accounts.

Belcher continues to be well maintained at about $980 bid, $1,000 asked. A dividend of $51 per foot has been declared out of the earnings of the past month. The ore taken from the upper or old works in this mine now averages $100 per ton, and from other portions of the claim the yield will exceed $50 per ton.

Chollar is in less favor, and 42 feet were dealt in, opening at $1,015, buyer 30, receding to $980, rallying to $990, and closing yesterday at $915. Receipts of bullion from this claim for the past month amounted to some $180,000 and the daily average product of ore exceeded 150 tons. A dividend of $40 per foot will be declared next week. The lode in the south mine is said to look as promising as ever.

Potosi is held at about $720. No sales have taken place this week. This claim is now yielding some 150 tons of ore per day, and the company in this city are in the receipt of their first shipment of bullion (some $20,000) since active operations were resumed. The trial of the Grass Valley *vs.* this Company has been fixed for the 10th inst.

Ophir is steady at $330 bid, $340 asked, and is strongly held. Empire Mill & Mining Company is offered at $475 per share. The regular dividend of $20 per share will be declared for the month of January.

Hale & Norcross is in rather more favor, and 10 feet were sold, advancing from $225 to $245, and closing at $260. The incline (outside the ledge) is now down some seventy feet from the lower level.

Unele Sam has been very actively dealt in, and 179 shares were sold, rising from $280 to $300, steadily declining to $250, and selling yesterday at $270. The body of ore found recently does not prove to be of much magnitude, but may lead to something more valuable.

Imperial continues dull, but is well held. Small sales have been made within a range of 117, seller 60, and $120 cash, closing at $120 asked. A dividend is anticipated for the month of January.

Burning Moscow has been active, as usual, and 2,500 shares were sold, advancing from $27½ to $40, buyer 30, receding to $33, slightly advancing, and selling yesterday afternoon at $37½.

Bullion has remained comparatively steady, and 150 shares were sold, within a range of $70@85, closing at $71 bid.

Sierra Nevada has been largely dealt in, and 1,135 shares changed hands, declining from $27½ to $22, rallying again to $27½, then dropping to $22 again, and selling at the close at $23.

North American advanced from $12 to $15; Baltic was sold at $20@22½; Nevada (J. G.) at $37½; Wide West at $7@7½; and Real del Monte at $9½.

The aggregate sales of Stocks and Legal Tender Notes since Saturday last amounted to $459,679.50

Our terms for MINING ADVERTISING are THE most ECONOMICAL of any paper in the State. The PRESS is the only true Mining Journal on the coast, and the only paper in whose columns mining notices can be judiciously concentrated.

MINING SHAREHOLDERS' DIRECTORY.

List of Notices of Meetings, Assessments and Delinqnent Sales.

Comprising the Names of Companies, District or County of Location, Amount of Assessment: Date of Meeting, Delinquent Advertisement and Sale, and the Place of Business of the Corporation if it is not in San Francisco.

REVISED EVERY ISSUE.

Advertised in the Mining and Scientific Press AND OTHER SAN FRANCISCO JOURNALS*.

BOUND VOLUMES READY.—Bound copies of Volume VIII of the MINING AND SCIENTIFIC PRESS, due the following honorable gentlemen, are now ready, and will be forwarde on receipt of their orders for the same:

Honorable Seth Martin, Nevada.
" R. A. Clark, Onion Valley, Plumas.
" J. P. Rhodes, Sacramento.
" A. A. Smith, Nevada.
" E. H. Snyder, Placer.
" O. P. Stidger, Nevada.

Give us directions how to send them, gentlemen.

Correct blank forms for advertising, and any information desired by advertisers, will be furnished, gratuitously, at the office of the MINING AND SCIENTIFIC PRESS.

SCIENTIFIC AND MINING JOURNAL.—This is as valuable a publication as is produced on the Pacific Coast, and one which interests all parties. It contains much that is instructive and entertaining, and seems to have the right men at the head of its affairs.—*Spirit of the Times.*

[ADVERTISEMENT.]

To the Public, and to Millmen in Particular.

As Thomas Varney has not, up to this date, withdrawn his notice in the "Mining and Scientific Press," in which appears the following language:—

"All persons are warned against purchasing machines made at the Miners' Foundry, called 'Wheeler's Amalgamators,' as they are an infringement on my patent, and a suit is now pending in the United States Circuit Court, against the parties infringing;"

In justice to myself I am compelled to give to the public a statement of the facts in the case, and show the position which Mr. Varney and myself occupy as Patentees. He commenced suit against me, and the Miners' Foundry, for $90 000, about the 1st of March 1863, and threatened suit against any and all persons who should buy my amalgamators, thus greatly damaging my business. To show the injustice of this suit against a "poor hard working mechanic," I will quote from the opinion of Judge Hoffman, as rendered in the case last November. He says:

This is an action for the infringement of a patent issued to the plaintiff on the 16th of December, 1862, for an "Improvement in Amalgamators for gold and silver." The mach ne alleged to be an infringement has also been patented—the patent being dated December 8th, 1863. The defendants deny the alleged infringements, and the novelty and originality of the plaintiff's invention. They have also given notice, under the statute, of various other defences, hereafter to be noticed.

Models of the two machines were exhibited in Court, and a large number of witnesses called to explain their construction and mode of operation. It is apparent that the patented machine of the defendant closely resembles, if it be not substantially identical with, the improved and modified machine now manufactured by the plaintiff. But the inquiry is not whether Wheeler's machine resembles that lately used by Varney, but whether the former is substantially the same as the machine described in Varney's patent. That Varney has, in many important particulars, modified the machine as described in his patent, is obvious. Indeed, his late machines resemble much more nearly in external appearance, and in their mode of operation, the Wheeler patented machine than they do a machine constructed according to the drawings and specifications of his patent.

After describing Mr. Varney's pan and its operation, the Judge says:

It appears, however, that the idea of working ores in a batch, by causing them to pass repeatedly between mullers, the upper one of which is provided with openings at the center, is by no means novel.

J. E. Clayton testifies that, so long ago as 1845, he arranged a machine in Tallahoosa, Alabama, for the reduction of gold ores, which embodied substantially the same principle.

* * * * * * *

In Overman's Metallurgy, p 267, a similar arrangement is described. * * * It is evident that the author is here describing an existing and well known machine, the usefulness of which has already been ascertained.

It is also apparent that the result aimed at is the same in this machine as in that of the plaintiff, and that the means adopted to accomplish it are substantially similar. In both machines the pulverization of the ore is effected by means of a bed plate upon which a muller rotates, with central openings to permit the pulp to pass continuously and repeatedly between the grinding surfaces until the operation is completed.

Amongst other things the Judge quotes the following from Judge Story:

But in all cases where the patentee claims anything as his own invention in his specification, Courts of law cannot reject the claim, and if included in the patent and found not to be new, the patent is void, however small and unimportant such asserted invention may be.

* * * * * * *

Here the plaintiff claims a particular position of machinery as his invention, and it clearly appears in evidence that the position is not new. It has existed before—not in machines exactly like the present, but in machines applied to analagous purposes, viz: in machines applied for the same purpose as the plaintiff applies them. The objection therefore, is fatal.

In the defendant's machine, the pan in two parts, provided with flanges, packing, &c., to which the plaintiff in his patent attaches so much importance, is not used, but a deep pan is substituted with a wooden cover.

The arrangement of the slots or shoes on the muller is different. The upper muller is provided with spiral ridges arranged to operate with similar ridges reversely inclined on the inner surface of the pan, to raise the pulp and promote the circulation. The upper muller is attached to the shaft by an universal joint, and by a mechanism qu te dissimilar to that described by the plaintiff. And for the scrapers are substituted bread guide plates extending and secured to the edge of the pan, and capable of being elevated or depressed by means of a mechanism not found in the plaintiff's machines.

Assuming then—as in the point of view in which we are considering it we must—that each of the several parts of the plaintiff's machine is old, and not separately patentable, it seems clear to me that if the patent for the machine can be sustained, as for a new combination; which I think doubtful, the combination of the defendant is at least as novel as that of the plaintiff.

We have already seen that the muller rotating upon a bed plate, with central openings, and arranged in a pan so as to create a circulation of the pulp, is not a new invention. The tub, composed of two parts, with flanges, packing, &c., is not claimed to have been used by the defendant. In fact it is now discarded by the plaintiff, and a deep pan, with muller attached by an universal joint, has been adopted by him in his later machines. The infringement, if any, must consist in the use by the defendant of the scrapers described in the plaintiff's patent.

The inquiry thus arises—are the curved plates described in Wheeler's patent, substantially the same in their structure and operation as the scrapers of the Varney patent, and if so, do the latter constitute a "material and substantial part of the things patented by Varney, definably distinguishable from the other part." To determine this question, a brief description of Wheeler's machine is necessary.

The Judge then describes the Wheeler pan and the Varney pan and scrapers, and says:

In the Wheeler pan four plates are used while Varney employs only two scrapers. The form or curve given to these plates in both machines is similar, though not identical; but in their structure, arrangement, and the use for which they are intended, there is an essential difference. The scrapers of Varney are represented as of inconsiderable width, and extending from a ring at the center to the periphery of the muller—they rest apparently upon the surface of the muller, and no means of elevating or depressing them are mentioned in the specifications or exhibited in the drawings.

The plates of Wheeler are of considerable width, and attached to a frame suspended from the top of the shaft, resting upon a vertical screw, by means of which the frame and plates attached to it may be elevated or depressed. The plates extend to the inner surface of the pan, where they are secured by slides. The office of these plates, as described in Wheeler's patent, has already been mentioned. It appears to me that the scrapers of Varney neither serve, nor were intended to serve, any such purpose. [Here the Judge gives his reasons for the above opinion.]

For these reasons I am of opinion that the curved plates of Wheeler differ from the scrapers of Varney in their form and arrangement, their object and effect, and that therefore their use is not an infringement of Varney's patent.

Much testimony was taken to show that in fact Wheeler's invention was prior to that of Varney's and that the latter derived his ideas from the former

It is claimed by Varney that his invention was, in its essential features, matured and perfected in August, 1861. But this statement seems hardly consistent with his declarations or his conduct.

Varney's application for his first patent was not made until the end of October, 1861. That machine has since been discarded as useless.

If then, at the time of this application, he had already matured and perfected the invention of another and far better machine, he committed a practical fraud upon the public in withholding from them the benefit of his skill and ingenuity. It is certainly strange that he should have gone to the trouble and expense of procuring a patent for his first machine, and delayed, for nearly a year, his application for a patent for the improved machine which he had, as he says, already invented.

It may well be doubted whether, if it be true as Varney states, that at the time of his application for his first patent he had already completed and perfected his improved machine, the suppression would not be fatal to both. It appears in evidence that, so early as December, 1861, Wheeler had conceived and communicated to Stewart & Kirkpatrick at Washoe, the idea of his machine. He explained to them the mode in which the circulation, or over and under current was to be produced, and the guide boards by which it was to be assisted.

In January, 1862, drawings of this machine were received at the Miner's foundry, and Stewart, the partner of Churchill, was desirous of having his pans constructed on that plan. The theory and construction of the proposed pan were fully explained to Varney, who succeeded, however, by affecting to consider Wheeler's pan a "humbug," in dissuading the parties from adopting it, and in inducing them to order pans made on the model of his own patent. These were subsequently discarded as useless. We are driven to adopt one of two suppositions: either that Varney willfully deceived Stewart in inducing him to order an inferior pan, or else that he had not at that time discovered the mode of producing the over and under current, recognized its utility and invented a machine to effect it.

Wheeler commenced manufacturing his machines in January, 1862. He commenced using them in June of the same year. They were constructed at the Miners' Foundry by the defendants to this cause, under the immediate observation of Varney. But in his conversation with Scott, in July, 1863, and in his communications with the defendants, he does not appear to have intimated that he was the first inventor of the Wheeler machine, and that in constructing the latter they were violating his rights. Up to the end of 1862, he continued to have his own pans built at the same foundry; and it he really considered the construction of Wheeler's pans to be an infringement of his own invention, his silence is inexplicable. His delay in applying for his second patent is equally unaccountable. In August, 1861, he had, as he says, completed and perfected his invention of his improved machine, and yet in October of that year he applies for a patent for his first and imperfect invention, and delays his application for a patent for his improved and perfected machine until the end of June, 1862—more than a month after Wheeler had taken the preliminary steps to obtain his patent.

It is unnecessary, however, to pursue this inquiry further, for in the view I have taken of the case the question of priority of invention is immaterial.

The Judge then notices the other grounds of defence, and says:

If this view of the effect of that statute be correct, it affords a defence to Wheeler as well as the other defendants. It is not pretended that he has used any machines not manufactured by them, or that he has infringed the plaintiff's rights, otherwise than by receiving from the other defendants the sum agreed to be paid by them on the sale of his machines.

I find, therefore, for the defendants.

[In this candid statement to the public, I should have preferred to have given the decision of the Judge and the findings of the Court in full, but for the great length of space they would occupy; and I will state that the same can be found in the "Mining and Scientific Press," of December 10th and 31st, 1864, and invite their thorough perusal.]

It will be seen by the above statements that Mr. Varney is infringing on my patent right by the use of wide guide plates in his pans, instead of my infringing on his patent. The truth is, he never used any but narrow scrapers in his pans until after I had put my pans in operation, and they had proved a success. None of his pans made prior to the year 1863 ever run six weeks without being condemned and thrown aside. This may account for the fact that he afterwards altered his patterns and made them like mine, with an open, deep pan, and wide guide plat s instead of scrapers, and put a wooden cover on the pans.

Having established my right in my patent Amalgamator, it is now my turn to protect myself against the infringement of "Mr. Varney, or any other man," and I intend to do it; and all persons are hereby warned not to purchase or use machines called "Varney's Amalgamators," as made at the Union Foundry, Pacific Foundry, or any other place, as they will make themselves liable for an infringement on my patent right.

Having made some important improvements in my Amalgamators, the public are invited to call and examine them at the Miners' Foundry, San Francisco, or at Prescott & Schiedel's Foundry, Marysville, where they are manufactured. ZENAS WHEELER.

San Francisco, Dec. 27th, 1864.

Astonishing Illegality of Mining Advertising.

The amount of mining corporation advertisements now being published in certain daily papers of this city in an illegal manner, and containing plain and gross violations of the recent Act concerning assessments of corporations, is really astonishing.

ADVERTISING IN SUPPLEMENTS has been decided by the Courts of the State of New York (after whose code the laws of California were framed,) as absolutely void; and we have the best of reasons for cautioning every prudent company against that class of advertising. Furthermore, there are continually numberless errors or discrepancies occurring, through MISAPPREHENSION OF THE LAW, on the part of advertisers.

We do not aim to raise unneccessary alarm, but simply perform our duty in admonishing parties interested against the storm of retribution, which is most surely awaiting the success of such companies as are now pursuing informal transactions, whether the same occur through carelessness, duplicity or ignorance.

The original bill for levying and collecting assessments, as first introduced before the last Legislature, we denounced as outrageous; as amended and passed, the Act is obnoxious and cumbersome to the mining community, and is rapidly preparing an enormous feast for the "legal fraternity" of this coast. Although very rigid, the law is no less specific in its main features, and when once minutely understood, its illiberal requisitions are very plain.

Mechanical.

ROCK DRILLING MACHINES.

A late number of the *Revue Contemporaine* of Paris, publishes a description of the machine which is employed for drilling in the Mount Cenis Tunnel. As is well known the machinery is set in motion by compressed air. A number of these machines are placed in a frame work which is made to fill the entire vertical area of the tunnel. Each separate machine consists of a pistou working horizontally in a cylinder, and carrying a chisel fixed upon it like a bayonet, which at each stroke dashes with violence against the rock to be pierced. Each time the chisel recoils, it turns round in the hole, and as the latter is sunk deeper, the frame or shield, which carries, not one, but nine perforators, advances in proportion. While the chisel is doing its work with extraordinary rapidity, a copper tnbe of small diameter keeps spurting water into the hole, by which means all the rubbish is washed out. Behind the shield there is a tender, which, by the aid of a pump set in motion by compressed air, feeds all these tubes with water. The air by which the pistons are driven is supplied by machinery outside of the tunnel. After a set of holes are bored, the shield is drawn back, the holes charged, and fired simultaneously by slow matches.

The especial point of interest to Californians in this machine, is the manuer in which the drill or "borer" is worked. Two machincs for drilling rock have been presented to Californians, each of which have been fully and repeatedly described in the MINING AND SCIENTIFIC PRESS. The difficulty with these machines appears to be the shock occasioned by the violent blow, which it appears to be impossible to take up by springs, after the manner attempted in them. In the machine used at Mount Cenis, which, by the way, is an invention of M. Sommelier a Frenchman, it will be seen that the blow is given and the recoil taken up by compressed air, which must effectually prevent any very damagiug shock from being communicated to the machinc. Cannot some of our inventors act upon the hint and give us a practical rock drilling machine for California?

QUICK WORK.—San Francisco mechanics, besides doing their work well, can also do it as quick, if not a little quicker, than it can be done in any other locality. Some idea of the manner in which they dispatch business may be inferred from the fact that an order was received at the Miners' Foundry on Monday, the 23d ult., at 4 P. M., for a complete quartz mill and miuing plant. The order was filled, and the machiuery all delivered to the returning steamer on the next Monday by 12 M., without working on the Sabbath. This order consisted of a 25-horse power engine, with two flue boilers, a steam pump, with hoisting works and bob mountings complete, and a battery of stamps with iron bed-plates. New patterns had to be made for most of the foundry-work, or, at least, old patterns had to be cut into sections, so that the heaviest piece should not exceed 400 pounds in weight, as the whole plant had to be packed, during the last portion of its transit, on the backs of mules. This machinery goes into the mountains in the rear of Mazatlan, Mexico. The messenger who come up with the order returned on the same steamer, with his machiuery all complete, in sections, for putting together at the mines. When he arrived, it was his expectation to lay over a trip; but the enterprise and energy of the proprietors of the Miners' Foundry saved him a month's time and consequent expenses.

MULLEAR'S SELF-REGULATING PLANE, is a new invention which appears to present a most important desideratum to carpenters, and all persons using the hand plane for smoothing wood. A full and illustrated description of this ingenious device, will be given in our next issue.

ONE of Redding & Hansbrow's hydraulic engines is to be put up in a quartz mill near Red Dog, Nevada county.

MOORE'S CENTRIFUGAL QUARTZ CRUSHER.—Mr. Moore, of the Vulcan Foundry, who exhibited a Centrifugal Quartz Crusher at the late Fair of the Mechanics' Institute, which attracted a large share of attention, has since that time, greatly improved and materially changed the construction of that machine, without at all interfering with the universally acknowledged correctness of the principle upon which it is constructed. The old arrangement of arms, strengthened by a heavy hub, and working in a vertical position, which presented several serious objections, and from the danger inseparable from the great speed with which it must be run, has now been entirely laid aside by Mr. Moore. The machine, as improved by him, works horizontally, and may be most economically placed *under the floor*, where no danger could arise, even in case of "bursting." The arms are securely confined between two disks, and the quartz fed into the center of the "hub," passing out to the circumference between the disks, and thrown by the enclosed arms against the surrounding corrugated surface, with the same effect as in the old machine. By this arrangement great efficiency is secured, and all danger avoided. Mr. Moore has one of these improved machines, about ready to run, at the Vulcan Foundry, in this city. It is well worth the attention of quartz miners. So confident are intelligent parties of its entire success that several orders for the machine have already been handed in. We shall probably have more to say in relation to it after it has received a practical trial, to which it will be subjected the coming week.

A MINER'S HAND AMALGAMATOR.—Mr. Samuel Fair, of this city, has taken the preliminary steps for taking out a patent for an amalgamator which is constructed as follows:—An oval shaped box or trough is prepared with a cover or lid. Upon the inside or underneath, by means of a double bottom, or otherwise, is placed a steam-chest, having two pipes, one of which is used to introduce steam, the other is employed to pass off the condensed steam. The steam box is for the purpose of heating the pulp, during the process of amalgamation A muller is introduced consisting of three or more iron wheels or round plates, which are placed upon a horizontal shaft, at intervals of about one foot; upon these wheels are placed shoes, running diagonally from one wheel to the other. Around the circumference of the wheels and about six inches apart strips of soft iron are placed, in casting, into the hard iron which forms the main portion of the shoe. The shaft is made secure by the use of stuffing boxes in which the journals run. The machine is made of sizes suitable either for steam or hand power.

Mr. Fair has also devised something new in the way of a quartz mill, which will be known as the "Miner's Quartz Mill." He is now experimenting with it, with the view of bringing it to a greater degree of perfection. A caveat for the same has been filed through the Patent Agency connected with this office.

THIERY'S CYLINDER AMALGAMATOR.—This invention consists of a barrel or cylinder of wood or iron, within which, by the revolution of the barrel, two or more iron rollers are made to follow one another, by their gravity, in close proximity upon the inside of the barrel, so that the ore may come in contact with the quicksilver by passing between the rollers, while the quicksilver, by its specific gravity, following underneath the rollers, is not ground, and thus subjected to loss. A patent for this invention has been applied for, through the Patent Agency connected with this office, by the inventor, Charles Thiery of Virginia city.

A PATENT has been taken out for a new method of hardening the surface of castings. When the piece is filled up, or otherwise finished, it is brought to a cherry-red heat, and then immersed till quite cold in a solution composed of 1,080 grammes of sulphuric acid and 65 grammes of nitric acid to 10 litres of water. It is said that the thickness of the stratum hardened is sufficient for all ordinary purposes, and that the iron suffers no distortion.

HOME MADE TOOLS.—Until quite recently, nearly all the heavy and expensive tools used in the machine shops of San Francisco, were imported from the East. We are pleased to observe, as a most gratifying change in this particular, that many of our foundrymen and machinists are now manufacturing their own tools, and retaining their cost for disbursement among our own people. While passing through the machine shop connected with the Miners' Foundry, a few days since, we noticed among other tools, a shaping machine, a pipe and bolt machine, two six foot lathes and a heavy punching machine, all made at that establishment.

A NEW PROPELLOR.—Mr. M. F. Strobel, of San Francisco, has inveuted, and applied, through the Patent Agency connected with this office, for a caveat for, a propellor for ships, constructed on an entirely new principle. The shape of this machine or instrument bears much resemblance to the fluke of a whale or porpoise. It is constructed of steel or other elastic or pliable material, tapering towards the end, and strong and stiff where it joins the vessel. The motion of the instrument is up and down, not rotary, so that the shaft or axle to which it is attached would describe an angle of about forty degrees from the level of the water.

PERSONAL.—We had the pleasure of a call from our old and popular friend, Col. Robert Lattimore. He is one of old Butte's pioneers, and for many years a resident in this place, where he has a host of friends and acquaintances. He is engaged as the travelling agent of the "Golden Era," and "MINING PRESS," of San Francisco, both of which are most valuable journals. We wish yon good success, Bob, and long may you live.—*Orville Union Record.*

Mining and Scientific Press Patent Agency.

SAN FRANCISCO.

Information About Obtaining Patents.

The Patent Law Amendment Act, of March 3th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent, And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention thereby described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made in the Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analagous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or unconmmon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftilmes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian, Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by conteuding for appeal. In such prosecutions we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos..	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every caveat.....	10
On every application for a patent.....	15
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the U. S. Court, of the District of Columbia. These appeals are heard by any of the Judges before whom the applicant may elects to bring the case. No oral. All the papers, models, etc., are sent by the Commissioner to the Judge, who then reviews the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty-five dollars. The Judge appoints a day of hearing. The applicant can appear in person or by counsel to state his case and file a written argument. Five days are allowed the opponent to put in an answer, and a similar period to the appellant for a closing reply.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

It is Impossible for editors to know all the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventions can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions or machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:
Saturday Morning, Feb. 4, 1865.

Canvassing Agents.

We would call attention to the following named agents of the Mining and Scientific Press as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the Press, will be acknowledged as a personal favor to us:—

Wm. R. Bradshaw—San Joaquin, Calaveras, Merced, Tuolumne, Stanislaus and Mariposa counties.

Mr. Robert Lattimore—Butte and Yuba counties.

Dwell Not Upon Troubles.—All our natural actions are accomplished without effort or thought. The act of breathing requires an effort only when we think about it. So with the cares and troubles of life. The greatest difficulty attending our troubles is usually the thought and reflection bestowed upon them. Mankind are divided into two classes in their efforts to avoid this dilemma—fools and philosophers. The former would drown his troubles in the intoxicating cup, or the still equally exciting maze of indiscriminate pleasure seeking. The philosopher seeks to bring about a forgetfulness of trouble by a constant effort to fill his mind with something useful and substantial. The former has for his reward the vanity of evanescent happiness, which is sure to leave its sting behind. The latter is preparing for himself a well of everlasting joy, which shall be a living spring of eternal pleasure.

The Redan Gold Mining Co., is the name of a new mining company, which filed its certificate of incorporation in the office of the County Court, of this city, on Saturday last. This company has been organized with a capital of $150,000, divided into 3,000 shares of $50 each, and is composed of some of our "solid" men. The trustees are S. P. Dewey, L. L. Robinson and Edward Martin. This company has been organized to work what is known as the "Redan Mine," of Grass Valley, Nevada County, a well known extension of the Henston Hill mine. We understand that the company will proceed immediately to the erection of suitable machinery for working the mine. It is located in a most promising neighborhood, and one in which heavy operations have been conducted for many years.

Very Rich.—Ten tons of rock from the Morning Star claim, Idaho, was crushed recently and yielded 1,000 pounds—12,000 ounces of bullion. The Oriental had fifty tons crushed, which paid $560 per ton; the Gambrinus mill after a run of sixteen days crushing—252 tons of rock—cleaned up over sixty-four thousand dollars, or over two hundred and fifty dollars per ton.

For Grass Valley.—A large sized boiler, made at the Washington Iron Works, Newburgh, New York, recently arrived in this city, and has gone forward to Grass Valley, marked to W. L. Coe, of that place.

Kerosene oil applied to the parts affected, is the latest cure for rheumatism.

Metallurgical Institute.—Mr. G. F. Deetken, a gentleman every way qualified, is about to open a school for practical instruction in metallurgy in the room over Mr. McKibbin's Iron Works, on First street, in this city. The course of instruction will comprise the various methods of roasting silver, gold and copper ores, illustrated, practically, by the aid of roasting furnaces, the various amalgamation processes, and the chloration of gold-bearing sulphurets; also, smelting and refining operations, etc. A laboratory will be connected with the institute, where assaying of the various ores will be taught. A course of mechanics, particularly as applied to mining—also mine surveying, drawing, etc., will soon be added. Mr. Deetken is well known in this State as a thorough practical mining engineer, and can give the most satisfactory references to all who may desire to avail themselves of his services in the above capacity.

A Board of Brokers for Grass Valley.—We learn from the Grass Valley *Union* that a number of gentlemen connected with the mines of that county have made arrangements for the establishment of a Board of Brokers in that town for the purpose of trading in the stock of mines exclusively in Nevada. A suitable room is being fitted up for the use of the Board, which will consist of twenty men who are all gentlemen of integrity, largely interested in the mines of that county, and thoroughly acquainted with their value and prospects. We fully agree with the *Union* that, taking into consideration the number, value, and increasing importance of the mines in that county, such a Board, if properly conducted, will be of infinite benefit to miners and capitalists, by introducing them to the public, under the endorsement of the responsible members. All "wild cat" stock will be excluded from the operations of the Board. Stock in no claims unprospected will be submitted to public notice through its agency. This course, if strictly pursued, will insure success to the enterprise.

Robbin's Hermetical Barrel.—The New York *Stockholder* says that this great commercial discovery is rapidly becoming adopted and indorsed as a success. Shipments of petroleum are constantly arriving at that city, and the most positive assurances are received from superintendents, merchants, shippers, and others, that in no instance has there been the loss of the least quantity of their contents from leakage or evaporation. It will also be a satisfaction as well as a surprise to dealers, and shippers generally, to know that invoices of naptha, benzole and gaseoline have survived the test of transportation from Oil Creek to New York without the slightest perceptible loss of their contents.

The above invention will soon create an especial interest in this State, where the handling and transportation of coal oil will soon become of great commercial importance. A full description of the manner in which this barrel is made was given on page 362 of volume IX of the Mining and Scientific Press.

A Practical Machine.—The Grass Valley *National* has heard of an individual who claims to be a "practical man," employed by a mining company in that vicinity to rig up a pump to drain their mine, using a ten-inch tube at the lower end of the shaft and two five-inch tubes on the upper portion, and was overwhelmed with astonishment at discovering that two five-inch tubes do not discharge as much as one of ten inches, with a common lift pump. It is impossible to calculate the loss miners and mill owners have suffered through the stupidity of such "practical men."

W. A. Holcomb, who for some months past has been acting Postmaster at Unionville, Humboldt county, Nevada, has received a commission constituting him Postmaster. He will prove a competent and an attentive officer, and will not fail to give general satisfaction.

Coal has reached so high a price that the Massachusetts railroads are going back to the use of wood as a cheaper fuel.

In the Southern papers news from the Northern States is headed, "From the United States."

THE GRASS VALLEY MINES.

[Extract from a private letter addressed to a gentleman of this City.]

* * * * This is an exceedingly interesting mining district, both for the number of extensive profitable mines, and for the promise of many more in consequence of the renewed interest in the region, and a better appreciation of its many advantages.

Numbers of the enterprising miners, who left here a few years ago for other fields of supposed greater promise, are now returning to their old claims, and are surprised at the richness and value of the ground they abandoned. Many of the veins which were prospected only to the depth attainable by the windlass rope, are now being opened and prepared for further development.

I am very much pleased with the veins. They are numerous and well defined, with all geological evidences of permanency, while they are generally well charged with free gold, giving from $20 to $160 per ton in the mills. There is scarcely a dump-pile of quartz in that region that does not show masses rich in free gold. The quartz, instead of growing poorer in gold as you descend, has in most cases been found richer than near the surface. The "Eureka" or Fricot's vein, is a notable example. The vein recently cut in the second level, 200 feet from the surface, is three feet in thickness, and is liberally spangled with gold. There is a fine new mill upon this property and others are erecting upon the continuation of the vein, which may be followed for a long distance, and is supposed to pass through the Burdett ground. A group of veins upon this claim has afforded considerable quantities of ore charged with coarse gold. In another part of the district, the Merrimac mill and mine is worthy of mention as a model of economical and effective working.

The Watt and the Rocky Bar mines upon Massachusetts Hill, the Allison Ranch mine, the "Lone Jack," the Lucky Co., and others are doing well, fully sustaining their reputation. In addition to the favorable character of the veins and their richness, Grass Valley has the following advantages: It is accessible, and is in a pleasant, healthy region, where provisions and transportation are cheap. It has a large population of skilled underground miners, attracted there by the several old established and profitable mines. There is no place in the State where such a fine body of miners can be found permanently settled with their families. Lumber and timber for the mines, and fuel, are abundant and cheap. An extensive growth of young pines over the hills that were denuded of their trees in early days, will afford excellent mining timbers in a few years.

With all these advantages, and an extensive region in which new discoveries of veins are constantly made by dilligent prospectors, Grass Valley is destined to become the chief mining center of California and may at no distant day merit the title of the *Freyberg of America.*

Yours truly,

Wm. P. Blake.

An Indian Warrior.—The Black Hawk *Journal* says that the Indians now in arms upon the plains have a leader in Black Kettle, not second to Black Hawk, perhaps not to Tecumseh, and as far superior to Gov. Evans and Col. Chivington combined, in shrewdness, in fairness, in general civic and military ability, as one man possibly could be to another.

Looking at the Fire.—Looking into the fire is very injurious to the eyes, particularly a coal fire. The stimulus of light and heat united, soon destroys the eyes. Looking at molten iron will soon destroy the sight. Reading in the twilight is injurious to the eyes, as they are obliged to make great exertion. Reading or sewing with a side light injures the eyes, as both eyes should be exposed to an equal degree of light. The reason is, the sympathy between the eyes is so great, that if the pupil of one is dilated by being kept partially in the shade, the one that is most exposed cannot contract itself sufficiently for protection, and will ultimately be injured. Those who wish to preserve their sight, should preserve their general health by correct habits, and give their eyes just work enough, with a due degree of light.

Experimental Furnace Building in Montgomery District, Esmeralda.

It appears from a correspondent of the Esmeralda *Union* that the miners of the new district of Montgomery manifest a most indomitable energy in their endeavors to discover the best method of working ores taken from their mines. The correspondent, writing under date of January 17th, says:—

For instance, Dan. Munckton's furnace is a failure. Instead of sitting down and "crying over spilled milk," he is hard at work putting up an arastra in company with George Hancock. Sol. Carter's first furnace is a failure—cause, want of flux. Tries another; no go—not sufficient blast. Tries a third, and now is satisfied that he has struck the right process; and, as I have above stated, as soon as they can get the fire-brick, Carter & Donegan will go ahead. Lyford's furnace not succeeding, he is after a mill. I could mention a half score more such men here, and these are of the kind who develop and build up a mining camp. Satisfied of the richness of the district, there is no despondency at partial failures, but "go ahead" is the principle that governs them.

It appears that on the day on which the letter was dated, Mr. Carter had made the first run from his latest constructed furnace; but the heat was so great as to melt the arch over the cupel, which was made of ordinary brick. He considered the experiment as quite sufficient, however, to prove that the plan of smelting which he had adopted would be perfectly successful when he had so constructed his works with the proper fire-proof material. A subsequent letter, dated two days later, says:

The furnace of Messrs. Carter & Donegan has been temporarily repaired, and they are now running off the metal. A quarry of stone has been struck near the Hot Springs, supposed to be capable of standing the most intense heat. It is now being tested, and should it result as hoped for, there will be no more trouble in smelting.

We shall take pleasure in reporting further progress from that interesting locality.

The Genii of the Mines.—We often wonder if the author of the Arabian Nights ever wandered through a land so prolific of strange events and wierdly wild scenery as this our new State. What food for thought, what material for the writer of legends is here furnished. What was the wealth of Aladdin's or Cassim Baba's caves to the treasures which lie buried in every hill that stands sentinel upon our city; and what the sudden transition from poverty to riches enjoyed by the poor wood-cutter of Bagdad to that experienced by some of our miners in a single day? These stories of Eastern romance, with all their improbabilities, are rendered commonplace when contrasted with events of everyday life in this strange land. Sometimes, while looking down into the yawning shafts, where the swarthy miner delves by the light of his flickering lamp, we have recalled the marvellous stories that charmed our childhood, and could almost imagine we inhabited the land of ghouls and affrites; and when the earth trembled above the mighty blast, as though some angry spirit was confined in its bosom, we have almost expected to see a colossal figure emerging from the smoke and flame, to bear us off to one of those enchanted palaces or fairy islands, where less favored mortals are never allowed to enter. But the mighty genii of our mines have more profitable work on hand than kidnapping knights of the quill. They dig far into the bosom of the earth, they wield the pick and the drill, they ignite the mine, and they bear to the light of day huge masses of dark ore. They build the mighty engines, where the red eyes of furnaces are never closed, they hurl the ponderous stamps which crush the rock and they transmute the dark pulp into shining gold and silver, which flows forth to enrich and gladden the heart of mankind. Their labors are unceasing, and the blessings they confer are manifold. The genii of our mines are Enterprise and Industry.—*Reese River Reveille.*

Winter Griddle Cakes should never be made of buckwheat flour alone, because it is very heating and provocative of eruptive diseases. The best combination is one-third buckwheat, one-third corn meal, and one-third middlings, or Graham flour. It is surprising what a great improvement Graham flour is to buckwheat cakes; even bran may be put in to advantage if the unbolted flour cannot be had. Mix the different kinds of meal with a little salt, a table-spoonful of baker's yeast and luke-warm water over night. The next morning try them to see if they have soured any, and if so, put in a small quantity of soda and saleratus in a little hot water, and bake on a perfectly clean griddle and with as small a quantity of grease as possible.

EASTERN AFFAIRS.

We are in the receipt of Eastern mail advices to January 4th. The close of the year 1864 has left a voluminous record of important events to be added to the pages of the world's history. It has been prolific of great financial, commercial and political perturbations at the East; but the great rebellion has overshadowed all these. Upon the commercial interests of the country the war has weighed heavily. It is true that many branches of business have been in a flourishing condition. The rise of prices incident to the anomalous condition of the currency, has been felt to an increased degree, and has produced its customary results. Industry and speculation alike have been powerfully stimulated, while the abundance of capital has encouraged enterprise of various descriptions. The high rates of foreign exchange and a war tariff have had the effect to foster domestic manufactures, and extraordinary activity and enormous profits have, in most instances, been the result. The import and export trade, on the other hand, has been to a great extent paralyzed, from causes familiar to business men, while the earnings of American tonnage have, in consequence, been greatly diminished. The business of the year 1864, throughout the loyal States, however, has occasioned comparatively little expansion of private credits, as the danger of carrying on an extended business of any kind upon any other than the cash system, has come to be very generally recognized.

The success with which the Government has been enabled, by the popular support to meet the strain put upon its finances, is among the most remarkable and gratifying features of the period under review. The gloomy feeling of last winter, spring, and a portion of the summer, together with the uncertainty as to the policy to be pursued by Congress, and a vast amount of reckless speculation in coin, raised the price of gold from 152 in the beginning of the year 1864 to 289 on the 11th of last July. The military success which followed, however, carried the price down to 189 on the 5th of October. Subsequently, with the varying fortunes of war, it rose to 206 on the 9th of November, since which time it has fluctuated between 195 and 230. These vibrations in the gold market have been accompanied by a remarkable success in funding the public obligations. Throughout the country and in continental Europe, United States bonds have been eagerly sought, with the noblest demonstrations of confidence towards the Government, in defense of which the money is contributed. The success with which the Government deals with a debt of great magnitude, has thus inspired the country with faith in its ability to cope with the future, heavy as are the burdens, present and prospective.

Our foreign relations during the past year would scarcely have interested the public very deeply, except for one or two special questions, of such recent occurrence that their recapitulation is unnecessary.

The general policy of the great Powers as to intervention has become so well settled as to greatly diminish the public interest in that topic.

To those who believe that in the Government of the world it stands decreed that this Republic is to remain intact as a secure asylum from Old World oppressions, our recent experience must afford confirmatory evidence of their hypothesis.

A Correction Corrected.—Our correspondent, "C. A.," took occasion, last week, to call us to account for changing the expression "*foot* pounds," employed by him several times in a previous communication, to "*feet* pounds.' Not having any authority by us at the time to establish the propriety of our correction of his manuscript, we allowed his expression of censure to pass. We are now, however, enabled to refer our correspondent to the American edition of the second volume of "Weisbach," page 123, and numerous other pages, for the use of the plural instead of the singular term, when more than one foot is implied.

SINGULAR DEVELOPMENT.

The Chicago *Times* of December 10th, contains a lengthy account of a wonderful development recently made a short distance outside of that city. It appears that a party of oil seekers were engaged in boring, and had reached a depth of 735 feet, through various strata, most of which, from the very surface, presented more or less strong indications of oil. Having reached the depth designated, the drill suddenly dropped several feet (as far as the machinery would allow it to go) without touching bottom. For two days, after the reservoir was struck, and up to the writing of the article for the *Times*, a constant stream of water had continued to be discharged from the top of the well, and had formed large ponds upon the prairie, which were hourly growing wider and deeper.

The Chicagonians, says the *Times*, now talk of supplying the city with water by these wells instead of the expensive tunnel they are cutting for a mile under the lake. The wells cost but $7,000 each, and raise the water from fifty to seventy-five feet, while the tunnel will cost $1,000,000 for construction and cause a constant expense in pumping the water into a reservoir afterwards. It is a question where this subterranean stream of fresh water comes from. The nearest mountains are those at the head of Lake Michigan, 300 miles distant. The depth of the well is but 708½ feet, while the mean depth of the lake has been stated at 1,000 feet. The water is said to be impregnated with sulphur and iron, but not so as to be unpleasant to the taste. At all events, the discovery promises to be of the greatest importance to the metropolitan city of the West, and will doubtless lead to a system of artesian wells on the arid prairies of Kansas, Dacotah and Nebraska.

Correction.—The article in our last week's issue, in which reference was made to a New York petroleum speculation, based upon certain oil lands in Santa Barbara county, was written under quite a misapprehension of the facts in the case. We are now fully assured that the adventurers in the above scheme have really a valuable property, although that value is doubtless much exaggerated in the above noticed report, and in most of the newspaper articles which have recently appeared in the New York journals in reference to it. We are assured by several parties, who are quite well acquainted with the ground alluded to, that the oil actually appears upon the surface in considerable quantities, much after the manner described in Professor Silliman's report, and that Mr. Gilbert has actually refined some 200 barrels, or one half the amount stated in the New York papers. This, we believe, is the only instance in which any considerable amount of oil has been distilled on the Pacific Coast.

Since writing the above a friend, holding intimate personal relations with Professor Silliman, has handed us the following defense of the Professor, to whom reference was made in the article under consideration. We cheerfully give it place in our columns.

Editors Mining and Scientific Press: An article in your last issue headed "Swindling Mining Schemes at the East" is grossly unjust to Professor Silliman. You admit that you may have been misinformed, and I wish to assure you that you certainly have been, and that the Professor's receipts probably did not reach a fifth part of the sum named. That he should shape his reports in accordance with the magnitude of his fee is incredible to those who know him. He would not listen to such a proposition. He may in some cases have consented to relinquish his fees, or the greater part of them, where, on examination, the properties proved to be worthless. Such propositions are often made to experts by parties who have made heavy expenditures upon mining property and wish to be informed whether their mines are valuable or worthless; if valuable they are both able and willing to pay, if the latter, they are anxious to avoid further loss. It is possible that Prof. Silliman's consideration to parties under such circumstances has led to your misapprehension.

There are doubtless many worthless mining properties offered to unsuspecting capitalists at the East, and the country is indebted to Prof. Silliman for discouraging many such schemes, as well as for his valuable and extended observations and descriptions of portions of our metalliferous resources. A Fellow Expert.

C. Z. I.

[Written for the Mining and Scientific Press.]

The Formation of Petroleum---The Cherry Theory.

Editors Press:—My attention has been called to an article on petroleum in the issue of the Mining and Scientific Press of the 21st ult., a few remarks which may do injustice to a geologist of acknowledged ability, at present residing in our State. You take exception to a theory as to the formation of petroleum, which, you remark, was put forth by a writer in the Pitt-burg (Penn.) *Chronicle*, and subsequently adopted by Mr. Cherry in a report to the Point Arena Petroleum Company. As the theory advanced in Mr. C.'s report is couched in quite similar language to that used by the writer in the Pittsburg *Chronicle*, some may imagine that Mr. C. adopted his ideas from said written articles, and not from reason and experience in the field, as was his duty as a geologist to do; and therefore the injustice. This theory has been extensively commented on, and has its admirers and denouncers, and, whether proved correct or otherwise, it is but just that the responsibility of starting it forth should rest with the proper party.

Several years ago the writer was employed to act as Mr. C.'s secretary during an extended exploration of the coal fields of Ohio, Kentucky, and Illinois. At that time, much attention was attracted to the then petroleum or rock oil phenomena, and many theories as to its formation were launched forth through the public press. In the course of his examination, Mr. Cherry, of course, gave a share of his attention to the matter, and in a report to his employers the theory, that "petroleum was formed by a chemical combination of the constituents of rocks forming the coal measures,' was first advanced. In an article on petroleum written for the press by Mr. C., about this time, this theory was again brought forward It first appeared, I think, in the Princeton *Republican*, though I am not quite sure that I have given the correct name of the journal, his correspondence being so extensive. I remember, however, that the theory, being a new one, and somewhat novel, attracted considerable attention at the time of its appearance, and was generally adopted as being correct. That the theory *originated* with Mr. Cherry, through investigations made by him, I am convinced. * * * * * *

As regards the truth of the theory, though convinced from experience in oil-fields that it is correct, I do not pretend to possess sufficient knowledge of the mysteries of geology and chemistry to present its merits in such satisfactory light as its author is capable of doing; but to every scientific man it is evident that Mr. Pique, in his attempt, quoted by you from the *Morning Call*, to prove Mr. Cherry's theory a fallacy, has only succeeded in completely refuting, in his own words, his own very learned arguments. [We can't see it.—Eds. Press.] No geologists on our coast have perhaps made so extended examinations, or prepared so many reports of our mining and other interests, and given the result to the public with fewer refutations or mistakes in judgment, than have the Messrs. Cherry, and none of the profession stand higher in the confidence of our mining men, and of Eastern mining men and capitalists, than they. It is a privilege they claim as a principle to be responsible for, and hold themselves in readiness to prove any theory they may advance; and I have no doubt that, were they at present in this city (they are now in the oil-field), they would be pleased to explain their theory of the formation of petroleum to the satisfaction of scientific men and all interested in our newly-developed oil treasures. J. S. J.

San Francisco, Jan. 27, 1865.

Murdered.—Mr. B. F. Capps, of Pokerville, Amador county, was found in his mining claim, on Wednesday morning, December 21st, shot through the head. No clue to the murder has yet been discovered. Mr. Capps was the discoverer and proprietor of the celebrated lead of auriferous sulphurets which bears his name, and in which claim he met with his untimely death at the hand of some cowardly assassin.

Opinions from Practical Tests of Tyler's Improved Water Wheel.

Enfield, N. H., January 25, 1859.

Friend John Tyler, West Lebanon, N. H.—It being generally understood that we are, and have been for a considerable time, using your improved Water Wheel, and having had very frequent inquiries in regard to their merits, I would say, having quite a number of the Wheels in use under various heads, from five and a half feet to thirty-five feet, and having a portion of them since 1854 in constant use, the same having required no repairs to the amount of twenty-five cents, and some of the Wheels have displaced Overshot, Breast and the celebrated Jonval Turbine Vandewater Wheels: having used and *seen used* most kinds of modern Wheels, *I can safely say that it is the best Wheel in my knowledge for steady power, saving of water and durability;* also well adapted to high or low heads—and particularly in back water, and is entirely free from clogging with anchor ice, leaves, or floating substances, and to which the modern Turbines are subject, and is a great consideration in selecting Wheels, with a suitable Rack at the head of the flume. As before said, there is none of this trouble with your Wheel. You are at liberty to use the above for the benefit of the public. C. M. Dyer,

Trustee of the Society of Shakers.

New London, Conn., Feb. 14, 1859.

Mr. John Tyler:—Your letter of the 16th requested us to give our opinion of the Tyler Water Wheel. We have one of your twenty-four inch Wheels under twenty and a half foot head and fall, driving two large paper engines, carrying two hundred and fifty pounds of stock each, with rope chopper. This it does, with power to spare. It takes the place of a sixteen feet Breast Wheel, with fourteen feet fall, that drove *one* engine and chopper, with no power to spare, with the same amount of water. Another of your thirty-six inch Wheels, under ten foot head and fall, driving one engine, carrying two hundred and fifty pounds of stock, with chopper, and fan pump to raise water for engine and machine. This it does, with power to spare, and by raising our fall to twelve and a half feet, we think we will be able to carry another paper engine of the same dimensions. Also another, a twenty-four inch, small size, under nine foot head, to drive our machine. It drives the paper machine with four inches of the gate drawn, and very steady. We are well satisfied with your Wheels, and think them to be the best Water Wheel *ever* used. We have a great many visitors to see our Wheels here. They leave with saying they are astonished to see so small a wheel do so much work.

Robertson & Bingham.

Stowe, Vt., March 12, 1859.

John Tyler, Esq.:—I have one of the Tyler Wheels in use in a grist mill. It is a thirty-six inch wheel, and runs under about ten feet head. It is the best wheel I ever had and will drive two run of stone with ease. I have it now in use to drive one run and a small mill.

W. H. H. Bingham.

Georgia Plains, Vt., Sept. 2, 1857.

John Tyler, Esq.:—In answer to your inquiries allow me to say that the power of your wheel is the wonder of us all. We have in our mill three eighteen inch wheels, each running a four foot four inch run of Burr stone, and grinding from ten to fifteen bushels per hour with ease and power to spare, under twenty-five feet head. The power, beauty and compactness of the wheel are enough to secure it in the favor of the public without further effort, and are sufficient to bring them into notice.

C. A. Hotchkiss.

Wawassan, Penn., February 26, 1859.

Mr. Wm. Dripps:—The Tyler Water Wheel you built for me has been running for the last three months to my perfect satisfaction. I have an average fall of about thirty feet, with a gate six by four inches, running four and a half feet stones one hundred and twenty turns per minute; have ground fine as ordinary grist mills twenty bushels of corn and oats per hour. Your wheel (eighteen-inch) I use in place of a twenty-four foot overshot wheel, and find by the change a gain of power equivalent, as near as I can estimate, to twenty-five per cent., with much greater satisfaction in working, as there is nothing to get out of order. Your fitting up of the wheel I consider excellent.

C. Brinton, Jr.

KINGSTON, Mass., Junuary 13, 1859.

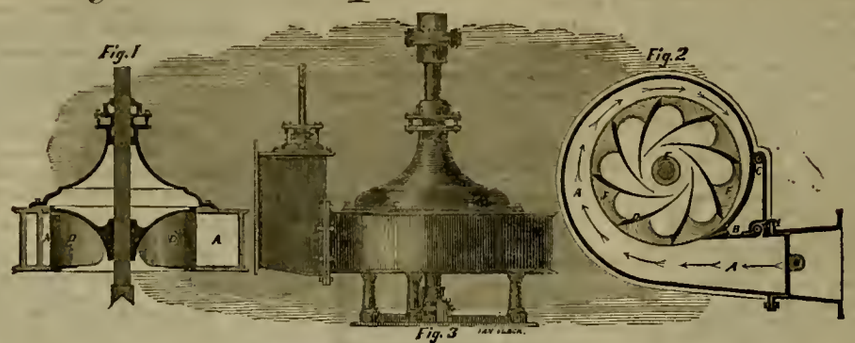
Mr. John Tyler:—Yours of the 8th inst., asking our opinion of the water wheel you sold us last July, is before us. In reply we will say that after seeing the model you showed us, and hearing what you had to say of the merits of your patent, we were well satisfied that it was one of the best of wheels. Six months experience of its use has fully confirmed the high expectations we then formed of it, and proved it to be in every respect all that you represented. Any one who is acquainted with water wheels, and who has worked upon them, will readily see that there has been great ingenuity displayed in the proportion and adaptation of the different parts to each other. We have never before seen a wheel in which we did not think we could see some chance for improvement, either in the adaptation of the buckets to receive the greatest possible force from the water, or in the manner of constructing the different parts. But in *your* wheel we have not yet seen the first thing which we think could be altered for the better. Our fall of water is eight and a half feet; our wheel is three and a half feet in diameter. We drive with it one of Olds' improved grain mills. The stones are thirty inches in diameter. The wheel will drive the mill four hundred and twenty-five turns per minute, and grind twenty-five bushels of well dried corn an hour, making meal of so good a quality that no one has yet asked for anything better. Should any one interested in such things see both our wheel and mill at work, and consider the amount of water we use, we think he would at once say that he could not reasonably look for any better.

THOMAS NEWCOMB & Co.,
Sea Island Cotton Thread Manufacturers.

WORTHINGTON, Hampshire Co., Mass., January 13, 1859.

John Tyler, Esq:—You desire me to give you a statement of the operation of your Wheels. I am using one of your twenty-four inch wheels, under twenty-five feet head, to drive *two* run of four feet Burr stones, and can grind from fifteen to twenty bushels Northern flint corn, fine, for table use, with one run; also wheat in the other run at the same time, as fast as it is suitable to run it into a thirty-two inch bolt; also smut machine, corn cracker, bolts and elevators—in fact all the machinery I have ready to run, and it does not seem to tax the power of the wheel at all. I don't know as I should be able to hold the wheel with all my machinery and stones at a medium speed, should I put on a full gate, as I have never used more than two-thirds gate for all my business. I would further add, I am on a very cold stream. For the past four days the mercury has ranged from zero to twenty degrees below, and I have run my wheel every working day, and have not cut a pound of ice, and my wheel stands out without any covering or protection from the snows or weather. This may seem strange, but it is even so.

LAFAYETTE STEVENS.



JERICHO CENTRE, Vt., Feb. 21, 1859.

John Tyler, Esq.:—Yours of the 14th is at hand, asking my opinion of the Tyler Wheel. In reply I can cheerfully say that the wheel gives entire satisfaction. I further state, it goes far beyond my expectation, It is all and even more than it is recommended. I have one twenty-four inch wheel, under twenty-two feet head and fall; drives one heavy upright saw for sawing logs, one cylinder mill for grinding corn, one eighteen-inch splitting saw, with gate hoisted five and a half inches. It takes the place of two Flutter wheels, and does more business with one third the water, and I think less. In short, it is the best wheel in my knowledge. We have one of the coldest streams in Vermont. We could do nothing in cold weather, but now we have run it all winter, in daytime, and have not cut ice at all. I can recommend it in good faith to all who wish a good wheel. GEO. A. CHAPMAN.

NEW LEBANON, Col. Co., N. Y., October 19, 1857.

Friend Tyler:—We take pleasure in furnishing you a statement of the merits of your Water Wheel. We have used four of them for several months, and they far exceed our most sanguine expectations. With one of your two-foot Wheels, under forty-three foot head, we can grind thirty bushels of corn per hour. We consider it the most beautiful Wheel we have ever seen, where great power is required, and but a small supply of water is to be had. Any one wishing to see them in operation can by calling at our mill. EDWARD FOWLER,
BENJAMIN GATES.

John Tyler's Improved Water Wheel.

Power and Working Velocity, and Water required for these Wheels.

TABLE, showing the number of inches of water (miners' measurement) required to give one horse power, under heads from 3 feet to 100 feet, and the horse power of wheels of all sizes.

TABLE, showing the number of inches of water required for different sizes of wheels from 9 inches to 48 inches in diameter.

TABLE, showing the number of revolutions per minute of different sized wheels from 9 in. to 48 in. in diameter.

Head in feet.	Number inches of water to one horse power.	Horse power of wheel 9 inches in diameter.	Horse power of wheel 14 inches in diameter.	Horse power of wheel 18 inches in diameter.	Horse power of wheel 24 inches in diameter.	Horse power of wheel 30 inches in diameter.	Horse power of wheel 36 inches in diameter.	Horse power of wheel 48 inches in diameter. EXPLANATION.—Find the head of water in the left hand column, and in a line with it, under the appropriate head, will be found the number of inches of water (miners' measurement) required for each horse power; the number required for each sized wheel; the horse power of each sized wheel; and also the number of revolutions per minute of each sized wheel.

This Invention received the Highest Prize Medal awarded to Water Wheels at the World's Exhibition, at the Crystal Palace, New York.

Wheels have been sold and are now running in most of the States and Territories in the Union, and in the Canadas. So thoroughly have they been tested that the subscribers have no hesitation in warranting them to give good satisfaction.

The following are some of the advantages claimed for Tyler's wheel over all others in use:

1st. Giving the best percentage of the water used.
2d. Its cheapness and durability.
3d. It runs equally as well *in* back water as *out*.
4th. It is not liable to freeze up.
5th. It is not obstructed by anchor-ice or other substances.
6th. It is adapted to high heads as well as low.
7th. It is not liable to get out of repair.
8th. It gives as good percentage with half gate as a full one.
9th. The friction on the step is materially lessened.
10th. The actual discharge of water is one-third less than the theoretical.
11th. It can be put to running by any machinist in a very short space of time.
12th. It is the steadiest running and easiest regulated wheel in use.

Parties in want of and interested in obtaining a valuable motive power, are requested to inform themselves further by referring to the parties using them, and those wishing circulars will please address the undersigned. All wheels are warranted to give satisfaction, and deeds for the right of use given only by the patentee or his authorized agents.

There are now some Fifteen Hundred of the wheels in operation in the United States and Canadas, driving all kinds of machinery, Cotton and Woolen Factories, Grist Mills, Saw and Paper Mills, &c., &c., under all heads from four to eighty feet, taking the place of Overshot, Brest and Turbine Wheels.

The attention of Commission Merchants is called to this wheel. It being portable, taking up but little room, it can be shipped to any part of the country with but little expense, and is an excellent wheel for the Pacific Territories, Nevada, Oregon, California, and Mexico, and all places where there are few mechanics, as it can be set running by any intelligent man.

☞ Orders solicited and promptly attended to, and circulars furnished, by

SMITH & HANSCOM, Agents for California.

Golden State Iron Works, San Francisco.

N. B.—Those ordering wheels, or making inquiries, should state particularly the head and fall, which way they want them to run, with or against the sun, the kind and amount of work to be done, also the town and county. ☞ Parties infringing on any of these patents—July 1855, 1856, 1858 & 1864—will be prosecuted.

CHOOSE A GREAT OBJECT.—The amount of life's achievement depends very much on the work that a man takes hold of. Wilberforce used to say of Sir Walter Scott's fine romances, that they always put him in mind of a *giant cracking nuts*. I saw at St. Omer's an illuminated manuscript which was the result of *thirty years of patient labor*. Alexander conquered the world and Paul evangelized it in less time than that. Many a man has taken as much time to fashion a curious toy as it would have taken him to build a house or a ship. Let us not work upon toys, for, labor long and hard as we will, we shall have nothing but toys to show at last as the result of our life's work. For no man's work can be higher than his aim or longer than his plan. The greatest object, incomparably, to which human wit and energy can be directed, and on which this frail and short life can be expended, is to serve God and save men. Whether we look at the inherent dignity of the object, or the vastness and durability of its results, or the magnificence of its rewards, it surpasses any other human enterprise infinitely more than St. Peter's at Rome surpasses the cob-house built by a child.

And what is peculiarly encouraging here is, that this mightiest of human or created works is within the reach of the weakest, and, though the rich man, out of his abundance, gives hundreds of dollars, and the contribution is paraded in the public journals as evidence of his wonderful liberality, yet may not God see in the limited gift of the poor man more to please Him than in the large douation of the other?

A poor man, though he has treasure in heaven, is often despised, whilst those in extensive possession of this world's goods are commonly regarded with deference and respect. And yet it is a beggar that received an angelic escort to the skies, while a rich man, lying upon his bed arranging for the accomodation of his increasing resources, is pronounced a "fool!"—*Standard.*

ONE OF THE BIG TREES, in the Calavcras grove named the "Old Maid," fell down last week. The tree was about twelve hundred years of age, and had attained the height of three hundred and twenty-five feet, and thirty feet across the butt.

PHOTOGRAPHIC.—The Central Pacific Company is having taken a series of photographic views of the more interesting points on the line of the road.

THE people of the South gave their soldiers a dinner on Christmas Day:

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alteration, which they may desire made in their advertisements, at their earliest convenience. New advertisements should be sent in as early as possible.

For Advertising Assessments on Saturdays.

Levy your Assessments upon any day EXCEPT FRIDAY.

Advertise the ASSESSMENT NOTICE on the FIRST FOUR SATURDAYS succeeding the day upon which the assessment is levied.

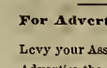
Appoint the day for advertising the DELINQUENT SALE on the FIFTH SATURDAY succeeding the date of levying the assessment.

Appoint the DAY OF SALE on the SEVENTH SATURDAY succeeding the date of levying the assessment, or any day *previous* to the Eighth Saturday.

Assessments ordered upon Saturday afford the Secretary the longest term in which to effect his advertising at the mine.

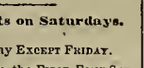
Extracts from the Statutes.

The attention of companies who desire advertising their delinquent sales in any other paper than that in which the notice of assessment appears, is called to the following section of the law approved April 4th, 1864:



Section 7. If any portion of the assessment mentioned in said notice shall remain unpaid on the day specified therein for the publication of the notice of sale, the Secretary shall, *unless otherwise ordered by the Board of Trustees*, cause to be published in the same papers in which the notice provided for in section five shall have been published, a notice substantially as follows, &c.

If, from a matter of convenience or necessity, the publication of an assessment is delayed, a very simple remedy is found in the following section of the law, relating thereto:



Section 14. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the nonperformance of any act required to be performed in order to enforce the payment of the same; but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall be void, and publication shall be begun anew

CHAMPAGNE CAKES.—One cup of sugar, one half cup of butter, two eggs, one half cup of sweet milk, one tea-spoonful of cream of tartar, one half tea-spoonful of soda. Mix with sifted flour to the consistency of cookies, cut in strips, which roll in powdered sugars, and twist into round cakes. Bake a very light brown.

A MASSACHUSETTS LEAD MINE.—The Hampton lead mine, in Southampton, Mass., recently shipped five tons of their ore to New York, the first ever sent from the mine. The ore was "dressed" up to eighty per cent. by concentrating, and is to be smelted in New York.

OFFICIAL advices had been received in Washington that Paraguay had declared war against Brazil. The decree was issued announcing the rupture of the treaty.

THE quantity of quicksilver produced this year at the New Almaden mine, the only one worked to any extent, was twenty six thousand flasks of seventy five pounds each, the whole valued at $1,527,000, against twenty-six thousand flasks last year, valued at $966,000.

IMPORTANT DISCOVERY
—IN THE—
Photographic Art.
Jacob Shew's
CHROMATIC PROCESS OF PRINTING PHOTOGRAPHS.
[PATENT APPLIED FOR.]

THE UNDERSIGNED WOULD ANNOUNCE TO THE public that he has discovered a new and IMPROVED PROCESS for printing Photographs, which produces a
SOFTNESS, CLEARNESS AND DELICACY OF TONE
unattainable by any other known process and to which he has given the above name. It is applicable to any size of Photograph, and those having valuable old negatives which they desire printed by the improved process can do so at any time.
In order to secure the pecuniary advantages to be derived from this important discovery a patent has been applied for. When obtained, the privileges of the right will be disposed of at a reasonable rate to any Photographer desiring it. In the meantime all are warned against encroachments upon the rights of the discoverer as such will be prosecuted to the full extent of the law.
"Cartes de Visite" and large Photographs printed by this process will be furnished at the prices of the ordinary work of other establishments.
☞ The public are invited to examine specimens at my Gallery. ☜
JACOB SHEW.

Machinery.

WM. BRUCKNER'S
Furnace for Roasting Ores,

Now in Operation at 416 Market street.
This Furnace, which is portable, and can be carried on muleback, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an Iron Cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of construction, renders this furnace a most
Economical and Practical Invention.
The furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three-fourths of a horse power for the smaller size. Parties wishing to erect such furnaces will please communicate to
W. BRUCKNER,
5v10 No. 416 Market Street, San Francisco.

IMPORTANT INVENTION.
Hunter's Concentrator, Amalgamator and Separator.
For the concentration of Gold, Silver and Copper ores, and separating all kinds of metals from the sands, where the specific gravity of the metal is greater than that of the rock, a machine is now on exhibition at the SAN FRANCISCO IRON WORKS, N. E. corner of Mission and Fremont streets, where it will be running from two to three o'clock P. M., for the inspection of all interested in mining. The inventor is prepared to manufacture machines to supply all orders promptly. The sixth of a horse power is sufficient to run one of these machines. For the above machine a patent has been applied for. Orders for machines, or for circulars and further information, should be addressed to
ANDREW HUNTER, Inventor.
The following extracts from Reports are submitted to the public as giving the results of a fair working test of these machines:

BEAR VALLEY, Dec. 12, 1864.
MR. A. HUNTER—*Dear Sir:* I take pleasure in stating, in reply to your request, that your concentrator has now been running uninterruptedly, at Princeton Mill, for more than three weeks, and the enclosed notes, by the Superintendent Mr. Williams, of a carefully measured test of its performance during a period of a day and three-quarters, I believe fairly indicates what it has been doing through the whole of that time. First, the loss of the sulphurets, per cubic foot of tailings from the Concentrator, was about one-tenth of an ounce. Second, the loss of sulphurets from the blankets was nearly *fifteen times greater* than that from the Concentrator. The Concentrator has not been found at any time in the slightest manner out of order, and has required scarcely any attention. Congratulating you upon the these facts, I am, sir, very respectfully yours. FRED. LAW OLMSTEAD,
Manager Mariposa Company.

Notes of test run of Hunter's Concentrator—it having been supplied during the test with the sands reduced by one battery of the Princeton Mill, in the condition in which they are usually received by the blankets:—

Running time	1¾ days.
Amalgam saved on the plates of the Separator during above time, value	$6 75
Rate of saving of single machine per day	3 86
Rate of saving of six machines per day	23 16
Yield of Sulphurets, 1¾ days, pounds	215
Yield of Sulphurets, one day run of one Machine	123
Rate per day of saving from six machines, being the whole number required for the Princeton Mill	738
Yield of amalgam from plates of Separator, per ton of rock crushed, value	55
Yield of sulphurets from Separator per ton of rock crushed, pounds	18

HANNIBAL WILLIAMS,
Superintendent Princeton Mill.
SAN FRANCISCO, Dec. 18, 1864.
I have recently examined one of Hunter's Concentrators and Amalgamators, in operation at the Princeton Mill, Mariposa Estate, the sand and crushed rock, flowing from one battery of four stamps, passing directly over the machine, without using blankets. On examination, it shows conclusively that the loss of sulphurets by the machine is much less than by the blankets, being but a mere fraction of the sulphurets, consisting of the light and thin scales, such as can scarcely be saved by panning; while on the other hand the tailings from the blankets contain a large amount of heavy sulphurets. The product of the machine is almost pure, clean sulphurets—the copper plates of the machine, being amalgamated, securing much or all of the free gold that escapes the battery. I witnessed the cleaning up of the machine, and the collection of a ball of amalgam. From the weights taken we may state the constitution of this ore, as it came from the batteries at that time, as follows:

Clean Sulphurets containing free gold and amalgam	18.00
Quartz sand, waste	1981.78
Loss of Sulphurets and tailings	.22
Total	2000.00

WM. P. BLAKE,
Professor of Mineralogy, Geology and Mining, Mining and Agricultural College, California.

To Correspondents.—"Is the Presence of Hot Water in Mines a Beneficial Indication, or Otherwise?" will appear in our next issue. "The Problem of Gold and Silver Extraction, No. 3," is again laid over. It will appear next week. The continuation of our remarks on "Petrolcum—How and Whcre to Find It," is also necessarily laid over this week.

Route to Idaho.—The Red Bluff *Independent* publishes a table of distances from San Francisco to Idaho City, by which it appears that the person who travels to Idaho by way of Portland must travel 1,725 miles, at a total cost of $128 for fare; while the person who goes by way of Red Bluff will have to travel only 605 miles at a cost of only $65. A line of stages is to be put upon the route from Red Bluff.

Send in Your Subscriptions!

A New Volume of the Press commenced on the 7th of January, and now is the time to renew your subscriptions. If you believe in supporting our paper, send us in your own subscription, and as many of your neighbors' names as possible.

Copies of Patent Claims.—We will promptly furnish, for a moderate fee, a copy of the *claim* of any patent issued by the U. S. Patent Office since the year 1836, on receiving the full name of the patentee, nature of his invention, date of the patent, and address of the person desiring the information.

The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water, or Steam Power. For further information address W. W. HANSCOM.

1 Golden State Iron Works, San Francisco.

FARRAND'S

Oscillating Amalgamator,

RECEIVED THE

ONLY PREMIUM

AWARDED FOR AMALGAMATORS

At the Recent Industrial Fair

OF THE

Mechanics' Institute of San Francisco.

Committee of Awards.

O. Belden, W. T. Garratt, H. P. Wakelee,
O. Gore, Geo. Johnson, C. M. Radcliff.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the lossby trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY,

W. D. FARRAND, Inventor,

R. L. OGDEN, Agent, SAN FRANCISCO.

S. E. corner Montgomery and California streets.

19v9

Disney's Cylinder Amalgamator.

The Cheapest and Best.

Disney's Cylinder Amalgamator, which has recently been introduced to the public, has already been proved a complete success, and can be furnished, at a price cheaper than any other in use. It is simple in construction, and so arranged as to do a large amount of work with the smallest expenditure of power. The proprietor is satisfied that he can do more work in a given time and with a given expenditure of power than any other amalgamator in use. For small companies who desire cheap yet effective machines, none can be more desirable.

It may be seen in operation at the Rail Road Foundry on Fremont street where

A NEW CRUSHER

Is in operation and he can crush and Amalgamate at the lowest rates. Miners and all others interested are invited to call and examine for themselves.

M. DISNEY, Patentee.

San Francisco, June 23, 1864. 1-3m

BAUX & GUIOD'S

Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refuse, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

Hepburn & Peterson's

AMALGAMATOR.

The Subscribers would call the attention of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines seems to the Miner a more Expeditious and Perfect Reduction and Amalgamation, less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. between 3d and 4th.

[Illustrated in the Mining and Scientific Press, April 9th, 864.] HEPBURN & PETERSON.

NOTICE TO MINERS.

NEW QUARTZ MILL.

The attention of all engaged in mining is called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. **B. FAUCHERY,** Engineer,

24v9

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

The attention of miners is respectfully requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of 1 on, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15-1m

PRATER'S

PATENT CONCENTRATOR.

The Proprietors of this New Concentrator, having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.

San Francisco, April 1st. 1864. 14v8-tf

Pacific

BEATER PRESS

Company.

San Francisco, California.

This Company are prepared to manufacture and sell the celebrated PORTABLE BEATER PRESS, so well known in the East, where it has, in the short space of two years, almost entirely superseded all other

HAY AND COTTON PRESSES.

This Press is easily moved from place to place, requiring only two span of horses over any ordinary road; is worked with great facility by steam or water power; and two men with a span of light horses in ten minutes time will turn out a bale of hay, in dimensions measuring three feet eleven inches in length, twenty-two inches width, and from twenty-four to twenty-eight inches in depth, and weighing from four hundred to five hundred pounds.

The fact that Beater Pressed hay commands a better price in market than any other, is substantiated by the market quotations of New York and other Atlantic as well as Western cities. Hay baled with this press is much cleaner than that baled by any other in use, being completely freed from all dust by the action of the beater, besides being so compactly pressed as to be fire and water proof.

This press is equally efficient for Cotton, Wool, Palm, Tow, Hemp, Hair, Manilla, Oakum, Hops, Rags, Shavings, &c. No other Press can make so good a bale of cotton, and make it retain its compact shape. Parties interested are invited to call and see one in operation.

Office and Warehouse—MISSION STREET, between Main and Beale streets.

W. H. MITCHELL, General Agent.

2v10

HUNT'S

IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

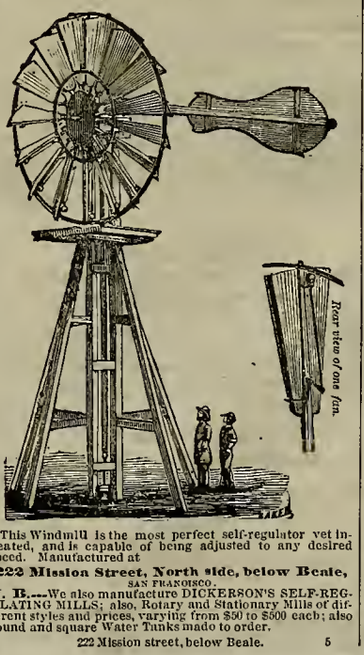
For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.



☞ For further Particulars see small circulars. ☜

E. O. HUNT,

No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

ATWOOD'S

Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet inveated, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,

SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

SALMON'S

PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

	No.	Fine		No.	Fine
Assay	250	913	Assay	300	990
Assay	285	941	Assay for Coxtman		980
Assay	286	940	Assay Water Rock		996
Assay	291	950	Assay Water Rock		998
Assay			St. Helena Ledge, W. D.		966

These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,

To whom all orders should be addressed. 15

DUNBAR'S

PATENT SELF-ADJUSTING

Piston-Packing.

Requires no Springs or Screws; Is always Steam Tight, without excessive friction, and never gets slack or leaky.

It will save each season many times its cost in friction, time, steam and power. No engine, old or new, should be without it. It can be easily fitted to old or new Pistons.

Having obtained the Agency of this Valuable Improvement, I am prepared to furnish it wherever desired. For further information, address HENRY S. SMITH,

23v8 Golden State Iron Works, San Francisco.

HUNT'S NEW DITCHER.

Having secured from the inventor the sole right to manufacture these Machines for the States of California and Oregon, and the Territory of Washington, I am now prepared to receive and promptly fill orders for these machines.

With the aid of three men and four horses this Machine will cut a ditch from two to three feet deep, as may be desired, dumping the earth all on one side so as to form a dike or embankment. For particulars send for circular, to

E. O. HUNT,

Windmill Builder, No. 28 Second Street and 110 & 112 Jessie Street, San Francisco. 9v22tf

THE NOVELTY.

This ROTARY CYLINDER GRINDER & AMALGAMATOR *did not receive* the premium at the Industrial Exhibition. The one there displayed worked one hundred pounds at a charge, and was classed merely as a model, honorable mention of which being made by the committee. The inventor is now manufacturing some of the larger size of this machine, capable of working Two Thousand Pounds at a charge, and requiring no more power than is necessary for the pans now in use working but one-third that amount. This machine is simple in construction, durable and compact, very easy to clean up and, in fact, is a perfect machine.

In using his Amalgamator to mislead the public the Inventor does not claim to have found the "Philosopher's Stone," nor any new method of extracting the precious metals from the ores, but does claim, as a practical mechanic and worker on mining machinery, that there was room for improvement in that direction, and that after much study, he has, by careful study, invented his improved ROTARY CYLINDER GRINDER AND AMALGAMATOR, known as the "NOVELTY," which mechanically overcomes the many difficulties that have heretofore arisen in the art of amalgamating ores.

This invention consists of a cylindrical-shaped case placed horizontally on legs, and provided with dies one and a half inches thick, making seventeen square feet of grinding surface, and having a rotary oblique muller (one or more) placed within it, and covered with shoes one and a half inches thick, and so constructed that all particles of rock must pass between the shoes and dies, causing it to be thoroughly reduced. The process of amalgamation is similar to that of the German Barrel, but much more rapid than that or any other amalgamator, as the muller gives three distinct motions to the pulp in one revolution. Heretofore, the chief objection to cylinder amalgamators has been the great wear and friction to which the journals were subject; but in this amalgamator that difficulty has been entirely overcome by the use of an adjustable metallic box, a new invention, that acts for the double purpose of a metallic packing and a journal box, and works to perfection.

This machine, when seen working will convince any practical man of its superiority over all others, and the public in general, and Miners and Millmen in particular, are invited to call and examine these machines, now in operation at the Miners' Foundry, where they are now being manufactured. Address, Miners' Foundry, San Francisco, Cal.

H. L. HOPKINS, Inventor and Patentee.

1v10

VARNEY'S

PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the best number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v10 San Francisco.

How to make your Remittances.—In most of the mining towns, bankers will furnish checks on San Francisco at par, (or at a very slight advance) to those who wish to pay us for subscriptions, advertising, mining blanks, etc. When it is more convenient, money may be remitted by mail at our risk if the parties sending will register their letters. Money sent by mail is seldom lost if properly enclosed. An excellent method is that of opening the layers of a card, placing the coins between the layers and sealing the edges together.

Memorandum for Secretaries.

Safe Rules for Advertising.

Make your order levying the assessment on any day EXCEPT FRIDAY, and advertise the Assessment Notice on the FIRST FOUR succeeding SATURDAYS, setting the day for delinquent advertising on the FIFTH SATURDAY, and the day of sale on the SEVENTH SATURDAY, or any day thereafter, PREVIOUS to the EIGHTH SATURDAY.

ADVERTISING IN THE INTERIOR.—If the mine or works of the corporation are located in any State or Territory of the United States, notice must be advertised there also, if a newspaper is published in the same county. On this account, SATURDAY is the best day on which to levy assessments, as thereby the longest period possible is gained for transmitting a copy to interior papers, which are usually published on Saturdays.

POSTPONEMENTS.—The date set for advertising delinquent stock, and the day of sale mentioned in either notice, may be *once* postponed for any period not to exceed ten days. Secretaries can avail themselves of this privilege when assessments are levied on Friday and they are obliged to advertise at the mine on Saturday, or desire to publish on that day at the place of incorporation.

ERRORS, OMISSIONS, OR DELAYS are definitely provided for in Section 14 of the new law, whereby it is plain that, if the advertising is delayed, the Secretary can only fix the dates for delinquent advertising and sale to suit the time he is to advertise, and proceed anew.

WHEN PAYABLE.—It is the usual custom to make the assessment "payable immediately," or upon some date within a day or two from the time of levying the assessment, although the law makes no requisition as to this matter.

BLANKS FURNISHED FREE to advertisers in the MINING AND SCIENTIFIC PRESS, for Assessment Notices, Delinquent Sales, Postponements, etc.; also copies of the Assessment Law of 1864. Copies of advertisements, for sending personal notice to shareholders, printed at $1 per hundred.

The PRESS is the most ECONOMICAL advertiser for stockholders, reliable and obliging for Trustees and Secretaries, and merits the patronage of the mining interests.

Mining Notices—Continued.

Agawam Gold and Silver Mining Company, Nye County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 4th day of January, 1865, an assessment of one dollar per share was levied upon the Capital Stock of said Company, payable on the 7th day of January, 1865, in United States gold coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 11th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Friday, the 3d day of March, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

G. M. BUDNHAM, Secretary.

Office, No. 509 Clay street, San Francisco. jan7-1-4

Black Hawk Mining Company, Chimhewavo District, San Diego County, California.

NOTICE.—At a Meeting of the Board of Trustees of the above Company, held this 23d day of January, 1865, it was voted that all assessments levied previous to this date, and covering assessments Nos. 1 & 2, be and are hereby declared null and void. All Stockholders having paid said assessments, or any portion thereof, will be credited respectively with the amount so paid, upon the next assessment levied by order of the Board. HENRY HALE, Secretary.

San Francisco, Jan. 23, 1865. 4-1

Blue Ledge Gold and Silver Mining Company, El Dorado County, Cal.

REMOVAL.—The office of the above named Company has been removed to Nos. 8 and 10, Government House.

J. M. BUFFINGTON, Secretary.

Office, Nos. 8 & 10 Government House, corner of Washington and Sansome Streets, San Francisco. jan7-1tf

Black Hawk Mining Company, Chimhewavo District, San Diego County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 23d day of January, 1865, an assessment of forty cents per share was levied upon the capital stock of said company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, Room 5, No. 424 Battery street, cor. Washington.

Any Stock upon which said Assessment shall remain unpaid on Saturday, the 25th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 11th day of March, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale.

Any Stockholders having paid assessments Nos. 1 & 2, or any portion thereof, will be credited the amount so paid on the above assessment. By order of the Board of Trustees.

HENRY HALE, Secretary.

Office, Room 5, No. 424 Battery street, corner Washington, San Francisco. Jan. 23, 1865. ja28-4-4

Black Rock Ledge Silver Mining Company, Reese River Mining District, Lander County, Nevada.

Notice is hereby given that there will be a meeting of the Stockholders of the above the Company, at the office of the Secretary, on the 18th day of February, 1865, at one o'clock P. M., for the purpose of electing Trustees, and such other business as may come before the meeting.

J. E. PURDY, Secretary,

Office, Room No. 7, N. W. corner Front and Clay streets, San Francisco. 3

Black Rock Ledge Silver Mining Company, Reese River Mining District, Lander County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 20th day of November, 1864, an Assessment (No. 4) of $3 per share was levied upon the capital stock of said Company, (and owing to a defect in the publication of the delinquent sale, the proceedings are this day, January 21st, ordered re-published) and and the same is hereby made payable, in United States gold coin, on or before the 25th day of February, 1865, to the Secretary, at his office, or to WM. ADAMS, Superintendent, at Austin, Nevada.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 25th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday the 11th day of March, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

Important to Californians.—Many Inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

George Washington Gold and Silver Mining Company, Silver Mountain District, California.

And in accordance with law, and an order of the Board of Trustees, made on the 12th day of December, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at the office of the company, No. 430 Montgomery street, San Francisco, California, on the 4th day of February, 1865, at the hour of 3 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

J. WARREN CLARK, Secretary.

Office, Room 5, third floor, No. 430 Montgomery street, San Francisco, California. 3

POSTPONEMENT.—The above sale is hereby postponed until Tuesday, February 14th, 1865, at the same hour and place. By order of the Board of Trustees.

3 J. WARREN CLARK, Secretary.

INVENTORS AND INVENTIONS.—Let us not cheapen inventions, but be kind to the inventors; beware of killing the goose that lays the golden egg! Many inventors die before the hour of triumph; others falter by the way. Invention is a struggle, a conflict, almost a battle; if the victors are rewarded, the dead are honored and the wounded carefully attended to. Glorify the inventors who succeed; cover with an indulgent self-respect the faults of those who fail; and soothe the last years of the wounded—those invalids of industrial science who have known only the pains of the fight, and always remained ignorant of the joys of victory. —[Dumas.

Gobernadora Silver Mining Company, San
Antonio District, Lower California.

And in accordance with law, and an order of the Board of Trustees, made on the 12th day of December, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the company, No. 430 Montgomery street, San Francisco, California, on the 4th day of February, 1865, at the hour of 3 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. WARREN CLARK, Secretary.

Office, Room 5, third floor, No 430 Montgomery street, San

Postponement.—The above sale is hereby postponed until Tuesday, February 14th, 1865, at the same hour and place. By order af the Board of Trustees.

5 J. WARREN CLARK, Secretary,

Mining Companies and others connected with the Mining Interests of California, will find all possible desired information in the *Mining and Scientific Press* of San Francisco which is an ably edited Journal, smartly handled, and well up to the times. The Mining Companies of California, are awake to the advantages of having their Mining Notices, comprising Assessments, Dividends, Elections, &c., concentrated in the advertising columns of one Journal, as we notice in the issue af the *Press* of May 7th, there are no less than seven pages of this interesting matter.—*U. S. Mining Journal, Railroad and Financial Advertiser, New York.*

And in accordance with law, and an order of the Board of Trustees, made on the 12th day of December, 1864, so many shares of each parcel of said stock as may be necessary, will be sold, at the office of the Company, No. 430 Montgomery street, San Francisco, on Tuesday, the 4th day of February, 1865, at the hour of 2½ o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. WARREN CLARK, Secretary.

Office, Room 5, third floor, No. 430 Montgomery street, San Francisco, California. 3

Postponement.—The above sale is hereby postponed until Tuesday, February 14th, 1865, at the same hour and place. By order of the Board of Trustees.

4 J. WARREN CLARK, Secretary.

George Washington Gold and Silver Mining
Company, Silver Mountain, California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 12th day of December, 1864, an assessment (No. 3) of 50 cents per share was levied upon the capital stock of said company, for the months of December and January, payable immediately to the Secretary, or to S. A. Hawkins, Superintendent, at Silver Mountain.

Any stock upon which said assessment shall remain unpaid on Saturday, the 21st day of January, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 4th day of February, 1865, at the office of the company.

Assessment No. 4 of 50 cents per share, for the months of February and March, 1865, due and payable as above on the 13th day of February, 1865. Any stock upon which said assessment shall remain unpaid on the 11th day of March, 1865, will be advertised on that day as delinquemt. and sold on the 25th day of March, 1865, at the office of the company. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.

Office, No. 430 Montgomery street, San Francisco. 25

Henry Clay Silver Mining Company, Reese
River Mining District, Lander County, Nevada.

Notice is hereby given that there will be a meeting of the Stockholders, of the above Company, at the office of the Secretary, on the 18th day of February, 1865, at one o'clock P. M., for the purpose of electing Trustees, and for such other business as may come before the meeting.

J. E. PURDY, Secretary.

Office, Room No. 7, N. W. corner Front and Clay streets, San Francisco. 3

Jewett Gold and Silver Mining Company,
Works at Gold Hill, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 24th day of January, 1865, an assessment of one dollar per share was levied upon the assessable capital stock of said company, payable on the 25th day of January, 1865, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 25th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall have been made before, will be sold on Saturday, the 11th day of March, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

A. M. COMSTOCK, Secretary

Office, No. 509 Clay street, City and County of San Francisco, California. ja28-4-4

Kelsey Gold and Silver Mining Company,
Kelsey District, El Dorado County, California.

Notice is herchy given, that at a meeting af the Board of Trustees of said company, held on the 9th day of January, 1865, an assessment of fifteen cents per share was levied upon the capital stock of said Company, payable on the 10th day of January, 1865, in United States gold and silver coin, to the Secretary, at his office, in the city of San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday the 11th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday the 27th day of February, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

S. C. GARDNER, Secretary.

Office, No. 8 Express Building, corner of California and Montgomery streets, San Francisco. ja14-2-3

Louisiana Silver Mining Company, Reese Riv-
er Mining District, Lander County, Nevada.

Notice is hereby given that there will be a meeting of the Stockholders of the above Company, at the office of the Secretary, on the 18th day of February, 1865, at one o'clock P. M., for the purpose of electing Trustees, and for such other business as may come before the meeting.

J. E. PURDY, Secretary.

Office, Room No. 7, N. W. corner Front and Clay streets, San Francisco. 3

La Paz Town Association, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 17th day of January, 1865, an assessment of fifty cents per share was levied upon the Capital Stock of said Company, payable on the 17th day of January, 1865, in United States gold and silver coin, to the Secretary, at the office of the company.

Any stock upon which said assessment shall remain unpaid on the Saturday the 18th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Tuesday, the 7th day of March, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

B. W. MUDGE, Secretary.

Office, No. 528 Clay street, San Francisco, Cal. ja2-3-4

Mount Davidson Gold and Silver Mining Com-
pany, Virginia District, Storey County, State of Nevada.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 11th day January, 1865, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, Room No. 63 Montgomery Black, San Francisco.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 11th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 27th day of February, 1865, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of tha Board of Trustees.

W. FELL, Secretary.

Office, No. 63 Montgomery Block, San Francisco, Cal.

Morning Star Gold and Silver Mining Compa-
ny, Echo District, Humboldt County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 29th day of December, 1864, an assessment of one dollar and twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to J. W. Shanklin, Secretary and Treasurer, at the office of the Company, No. 625 Merchant street, U. S. Land Office Building, San Francisco.

This assessment is made subject to such credit for the stockholders as may have been allowed them on any payments of assessments, or expenses of incorporation, and the filing of the necessary vouchers on the same.

Any stock upon which said assessment shall remain unpaid on Saturday, the 25th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 17th day of March, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. W. SHANKLIN, Secretary.

Office, No. 625 Merchant street, San Francisco. 3-4

Mammoth Gold and Silver Mining Company,
Silver Mountain District, California.

And in accordance with law, and an order of the Board of Trustees, made on the 12th day of December, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at the office of the Company, No. 430 Montgomery street, San Francisco, California, on the 28th day of January, 1865, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment, together with costs of advertising and expenses of the sale.

J. WARREN CLARK, Secretary.

Office, No. 430 Montgomery street (Room No. 5 up stairs), San Francisco. ja14-2

Postponement.—The above sale is postponed until Tuesday, February 7th, 1864, at the same hour and place. By order of the Board of Trustees.

4-2 J. WARREN CLARK, Secretary.

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the Mining and Scientific Press. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

Mosquito Quartz Mining Company, Calaveras County, California.

NOTICE.—There are delinquent, upon the following described Stock, on account of Assessment levied on the 19th day of December, 1864, the several amounts set opposite the names of the respective Shareholders as follows:—

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Sierra Consolidated Gold and Silver Mining Company. Mine located in Sierra and Nevada Counties California.

Constitution and By-Laws

—OF—

Mining and Prospecting Companies

Elegantly printed, with care and dispatch, at the office of the

Mining and Scientific Press.

☞ Orders from the interior faithfully attended to. Packages which can be judiciously sent by mail will be prepaid at our expense.

Canvassing Agents.

We would call attention to the following named agents of the Mining and Scientific Press as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the Press, will be acknowledged as a personal favor to us:—

Wm. R. Bradshaw—San Joaquin, Calaveras, Merced, Tuolumne, Stanislaus and Mariposa counties.

Mr. Robert Lattimore—Butte and Yuba counties.

J. M. Wolf—Sacramento, Placer and El Dorado counties.

W. T. GARRATT,

City

BRASS AND BELL FOUNDER,

Cor. Market and First Sts., opposite Oriental Hotel, SAN FRANCISCO.

Manufacturer of Brass, Zinc, and Anti-Friction or

Babbet Metal Castings;

CHURCH AND STEAMBOAT

BELLS,

TAVERN AND HAND BELLS AND GONGS,

FIRE ENGINES, FORCE AND LIFT PUMPS,

Steam, Liquor, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder, and Copper Rivets, &c. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles,

HYDRAULIC PIPES AND NOZZELS

For Mining purposes, Iron Steam Pipe furnished with Fittings, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."

☞ Highest Market price paid for OLD BELLS, COPPER AND BRASS. ☜ 6tf

TO MINE OWNERS.

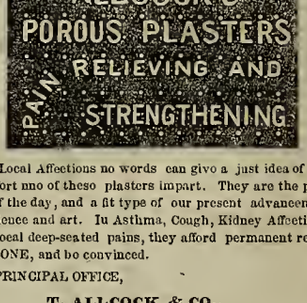
REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Address **J. MOSHEIMER,**



Office, Nos. 14 & 15 Mead's Building, Corner of Pine and Montgomery Streets, San Francisco. 9v23tfq

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat, pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

A SELF-REGULATING PLANE.

We give annexed an illustration of Mullear's Self-Regulating Plane—an improvement designed to avoid the delay and inconvenience experienced from the clogging of the plane, as ordinarily constructed. It is claimed that with this improvement it is impossible for a plane to clog, and that, the cutting iron being so firmly held that no vibration can occur, the tool accomplishes its work much neater, and requires less force, than with the instrument now in general use.

The accompanying illustration presents a sectional view of the plane, as it would appear if cut through at the center lengthwise.

GEORGE MULLEAR'S IMPROVED PLANE.

C represents the cutting iron, which is held in its place by two beveled iron bearings, near M and N, which are controlled by the set-screw F and the rod I, regulated by a nut and screw at E. These bearings are also assisted by the cap iron G H, which is so nicely adjusted at the cutting edge of the iron C that it is impossible for any shavings, or even dust, to find its way between the bearing surfaces of the two irons.

This improvement is applicable to all bench planes where double irons are used. We would commend the attention of carpenters, and all others using this class of instruments, to this invention. Further particulars may be obtained by addressing George Mullear, San Francisco.

Aurantine.—We are indebted to Messrs. Burlingame & Co., 528 Montgomery street, for a bottle of the recently discovered substance, alluded to at considerable length in another column as a new California resinous production. These gentlemen are the sole agents for the sale of the article under the above name, which is neatly put up in small bottles, suitable for convenient use for sprains, bruises, etc; also as an erasive liquid for removing oil stains from various fabrics. The article before us appears to be of a very superior quality, and is known as "Aurantine," from its near resemblance, in odor, to that of the orange-blossom. It possesses all the peculiar virtues of turpentine, and many others added, without any of its offensive odor. It bids fair to become an important article in the toilet or medicine chest of every household.

Large Sales.—A large number of sales of feet in ledges, at and near Indian Valley, says the Quincy *Union*, amounting to over $70,000, have been made during the past three weeks.

THE NEW GUM RESIN—ANOTHER CALIFORNIA PRODUCTION.

We have several times alluded to the production in California of a new substance obtained from the distillation of the resin from a peculiar variety of pine, indigenous to certain sections of this State. Pitch gatherers have, for some time, been aware of the existence of this gum, and also of the fact that it would not produce the ordinary quality of turpentine employed for commercial purposes. Indeed, it is said that the liquid obtained from the distillation thereof has been known in this city for several years, but it is only quite recently that the trade has become apprised of its great commercial value. It appears that Mr. Fairbanks, a turpentine manufacturer of Butte county, recently made an accidental hit by which he succeeded in readily obtaining the liquid, which he styled a new kind of turpentine (and which it really is), although it exhibited scarcely any of the characteristics of that liquid, either in appearance, smell, taste, weight, or volatility. Its odor is like a mixture of oil of lemons and balsam. It has recently been taken in hand by several skillful chemists, who have discovered that it possesses some most remarkable properties, which bid fair to render it a matter of great commercial importance.

The value of this discovery may be estimated, to some extent, from the following enumeration of the uses to which it is already ascertained to be applicable: It may be rendered serviceable to the perfumer, and for flavorings; it will afford light and heat in the two forms of burning fluid, and as candles; it can be made useful to the painter in his varnishes, and in his paints as a drying medium; to the dyer, it affords a most convenient, cheap, and effective cleanser, readily removing stains of an oily nature from silk, cotton, or woolen goods; the druggist will find it of value in obtaining his extracts; the lithographic artist will find it useful in preparing his stone; the doctor, or rather his patient, will have cause to feel grateful for its use as a plaster, or for its anæsthetic properties, for it is found to possess the same influence on the living system as chloroform. It is also said to be exceedingly valuable as an external application in cases of rheumatism, sprains, bruises, cuts, burns, etc.

It will scarcely be claimed that its full economic value has yet been ascertained; much is doubtless still left for our skillful, practical chemists, to discover in relation to its wonderful properties and varied applicability. The tree from which it is obtained is found in great abundance in our mountains, and the yield of that variety of pitch is said to be fully equal, if not in excess, of that of the ordinary turpentine-yielding variety. The world is thus indebted to California for another new and valuable article of commerce.

So general and important an article of trade has this new preparation become, that quite a number of firms have entered upon its manufacture, each, as a general thing, adopting a name of their own. Thus we have now advertised "Aurantine," "Erosine," "Theoline," and "Antimoniated Fluid," as so many trademarks—if not all for the same thing, at least all for a valuable article, the result of the various methods of treating one of our new and useful California products.

Cotton from Corn.—A company has been formed in New York with a million dollars capital, to make sugar and syrup from corn, under Professor Goessling's patent, the Prof. selling out his claims for $600,000. It is said experiments have already succeeded in the production of three and a half gallons of syrup from a bushel of corn. It is said that the process of making sugar from this patent is so simple that it can be made by every housekeeper. A bushel of corn will give three or four gallons of beautiful syrup.

A Curious Animal may be seen at the curiosity shop on the corner of Washington and Davis streets, known as the Iguana. It is a rare specie of the lizard family, which, revolting as it looks to the American epicure, is nevertheless considered a great table delicacy in the West India Islands, Central and South America. The specimen here alluded to was brought from the Isthmus. Its body is about twelve inches in length, with a caudal extension of fully *three feet*. It is well worth going to see.

Correction.—In the article by "Delta," of last week, on Calvert's Process, the sentence "as the sulphide of gold is easily converted into chloride of gold again by an *excess* of free *chlorine* gas," should have read—"by an *escape* of free *chloric* gas."

An advertisement in a newspaper is like a circle in the water, continually spreading itself. Throw rocks in and try it.

The Mining and Scientific Press.—We call the attention of our readers to an article from this valuable journal, explaining some of the reasons why it should be supported. We have no hesitation in saying it is one of the most deserving publications on the coast, in fact, the only legitimate mining journal in California. Every practical pick and shovel miner, as well as every man who may be anywise interested in mining, should have the *Press* for his own information, aside from its scientific value. Its editors and contributors are men of practical experience and qualified to speak that which they know.—*Grass Valley Union*.

Mining Press.—The San Francisco *Mining Press* has entered upon its tenth volume, and bears evidence of increasing prosperity. Dewey & Co. have, by untiring industry, made the *Press* one of the leading papers of the State, and as a mining journal it has no superior in the country. Those interested in the mines on this coast can make no better investment of five dollars than by subscribing to this excellent journal.—*Alpine (Markleeville) Chronicle*.

The "Mining and Scientific Press" is an excellent journal, and ought to be subscribed for by every miner and artisan on the Pacific coast.—*Nevada Daily Gazette*.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Is the Presence of Hot Water in Mines a Beneficial Indication or Otherwise?

BY T. ROWLANDSON, FELLOW OF THE GEOLOGICAL SOCIETY, LONDON.

The occurrence recently of an irruption of hot water into the Ophir mine has attracted attention to the question which forms the heading of this article. The irruption of hot water into mines is not altogether a novel, although a somewhat unusual circumstance, as it may be learned by reference to a list of several such which appeared in the Mining and Scientific Press of January 7th, in which, however, the question whether any economical inference may be drawn therefrom was not dwelt upon.

Before detailing any personal views, it may perhaps be well to briefly notice what are the popular ideas on the subject. These may be stated as favorable, though upon what data it would be difficult to point out, excepting it be from the coincidence that some of the most productive and extensively worked copper mines in the world, namely, those situated in the parish of Gwennap, Cornwall, are even more remarkable for the high temperature of many of the deep workings in that vicinity, but particularly so for the more than usual influx therein of streams of water at unusually high temperatures. So far as physical or chemical analogy can be brought to bear on the subject, based on observations hitherto made, the conclusions come to can only be of a neutral character, for in no instance can it be thoroughly demonstrated that the *value* of any mine or lode has been increased in consequence of the presence of such thermal streams. About twelve months ago the shareholders of the South Seaton mine, England, became excited owing to hot water having been cut in one of their levels, and great expectations were based thereon, which, as far as the writer is acquainted, have not been fulfilled up to the present time. The truth is, this basing high anticipations on any unexpected phenomenon, without assigning therefor any better reasoning than that which jocularly assigns the existence of the Goodwin sands to the contiguity of Tenterden church steeple, only indicates how very low is the scientific knowledge of those usually entrusted with the management of mines, and may be classed along with the very commonly favorable anticipations, predicated on such circumstances as water levels, the percentage of silver increasing as the mines deepens, &c., &c., some of which possess no necessary connection, and others, like the one last alluded to, are wholly opposed to facts.

The crude and illusory opinions noticed, are the necessary consequences of the hitherto empirical character of mining, arising from the circumstance of the management of mines being almost invariably placed under the control of parties wholly uneducated in those sciences, without a thorough knowledge of which it is impossible, except by accident, to form correct deductions from any special phenomenon, usual or unusual; the consequence is, when such occur of a more extraordinary character than common, fancy is allowed to run riot, untrammelled by sober reason, and bright visionary dreams of El Dorado fill the imagination of such confiding stockholders as possess faith in these supposed indications, until time and additional exploring commonly dissipate the delusion.

It has already been stated that, hitherto, nothing has been ascertained calculated to show that thermal springs in mines indicate anything either favorable or unfavorable, as regards the economic value of mineral veins; it, however, by no means follows, because heretofore such has been the case, that therefore in the future none will be discovered. I have, therefore, waited anxiously to see what the Superintendent of the Ophir has to report upon the subject; but so far have been disappointed. Surely out of the large sum paid in salaries by the Ophir company, some one employee ought to be found who could give us an analysis of the irrupted water, and also some natural theory as to its possible origin and its probable influence on the future working of the mine. If none such exist, it is pretty plain proof that its staff of officers is a most inefficient one, however expensive it may be, and needs a revision; for the practical deductions to be derived therefrom may prove of great value to the stockholders, whilst the theoretical ones may be of great scientific interest.

The most notable instance of hot springs in a mine, is that known in the Wheal Clifford (Gwennap, England), where a large spring of water of high temperature was cut so long ago as 1839; in 1855, Professor Smyth found the same issuing from a fissure at a temperature of 114° Fahr., at a depth of about 1,510 feet. At a more recent visit, (in July last,) Professor Smyth states that, at a depth of 1,650 feet, a little rill showed a temperature of 121°, whilst a larger feeder which fell from an upper working was from 119° to 120° * * * * The next level (higher) was advanced seventy fathoms further eastward, where the lode is described as exhibiting a good breadth of fine black-coated copper pyrites, where small feeders of water almost scalded the fingers while holding the thermometer, which marked 122° the air in the last few feet was 112 and loaded with vapor. Professor Smyth remarks that although 122° was the highest degree of heat observed by him, he deemed it probable that when the hotter, or 225 fathoms level, (below the adit) is advanced further eastward, the temperature of the chief gush of water will be found much higher.

Professor Smyth pretty well establishes the point that the high temperature of these waters cannot be attributed to the decomposition of the sulphides as might not unfairly have been surmised, for the writer of this has witnessed, in the Wicklow (Ireland) Pyrites mines, as high a temperature as that found in Wheal Clifford, in the vicinity of decomposing large bodies of sulphides of iron, intermixed with sulphide of zinc, at the former described place. The fact however that the analysis of the water at the Wheal Clifford indicates no traces of copper or the ordinary metals, the richness of the ore (for it is rich) contiguous thereto, cannot, therefore, be attributed to this cause.

The flow of water is about 180 gallons per minute, which contains about 540 grains of solid matter, upwards of 500 of which are chlorides, nearly 300 being chloride of sodium, and 270 chloride of magnesium, from which it has been inferred that owing to its composition, the water could not be derived from the ocean, below the surface of which, these hot waters issue at a depth of 1,500 feet. Such may be the case, although the different composition, as compared with sea water, ought not to be accepted as fully establishing that circumstance. The reasons to be adduced against such a conclusion would form a lengthy paper; and must, therefore, for the present be dismissed.

The most noticeable feature connected with the Wheal Clifford spring, is the comparatively great quantity of chloride of lithium afforded, forming a total equal to about 800 pounds per day, or twenty-one grains per gallon. It will be interesting to know what is the temperature of the water at its influx into the Ophir, and its chemical composition; if it contains salts of iron, zinc, copper, etc., it may be inferred that its high temperature is caused by the presence of decomposing ore, if only the alkaline and earthy salts are present, as at the Wheal Clifford, the source may be presumed to be deep seated, and the company may prepare for the continuous employment of extensive pumping machinery; if the former, the indications will be favorable for future remunerative discoveries. There is one way in which there exists a possibility that, notwithstanding the hot water, as it issues, may only contain alkaline and earthy salts, the irruption may not be very lasting; namely, the possible connection of the spring with caverns such as are known to occasion intermittent springs, whilst the high temperature is acquired by the decomposition of ores at a great depth below their level. The chances however, are greatly against such being the cause. The ingenuity of the managers of the mine might be profitably engaged in utilitizing the hot water, and at least lessening the injury arising therefrom, although probably not sufficiently so as to cover the entire cost attendant on the irruption. It would not require much ingenuity to accomplish this.

[Written for the Mining and Scientific Press.]

From our Journeying Correspondent.

Jamestown, February 4, 1865.

Eds. Press:—I took advantage of the fine weather, on Monday, to visit the quartz mines at Quartz Mountain and Poverty Hill. First among these stands the App claim, owned by Messrs. John App & Co., which I noticed in my last. Since writing, I have visited their tunnel, and am much pleased with the manner in which it is worked. The tunnel penetrates the mountain to the distance of five hundred feet, where an engine room is excavated in the earth, and two small steam engines are employed in hoisting the quartz from the shaft of the mine, which has a depth of 130 feet below the tunnel. Adjoining this is the

HESLIP CLAIM,

Owned by the Heslip Brothers, who have run a tunnel some 250 feet into the mountain, and sunk on the ledge some eighty feet below its level, and are taking out very good rock. They have a ten-stamp water-mill, and have a prospect of making fair profits from their investments. Mr. Wm. Heslip has shown me every favor that I could expect from a personal friend, giving me information and discussing with me his favorite theories on the ever interesting question of the extraction of gold from its ores. I am indebted to him for much of the pleasure and profit of my stay at this place. On Monday, at Poverty Hill, I enjoyed the hospitality of Mr. Boice, Superintendent of

THE GOLDEN RULE.

This claim is owned by a joint-stock company, of 3,000 shares. They are working a ledge of quartzose slate, of a variable character. The little quartz in the vein is very rich, and with their facilities for working will undoubtedly be profitable. A tunnel, 500 feet in length, pierces the hill from one side to the other, giving, on one side, a dump for the waste rock, and ending at the other in a shaft, through which the paying quartz is raised to the surface, a distance of eighty feet. They have a four-stamp water-mill on Sullivan's creek, which is capable of crushing six tons of rock in twenty-four hours, which is about what is furnished by the mine.

The rain on Tuesday kept me idle and indoors until late in the afternoon, when I took the stage for Sonora. Here I found a friend in the person of Postmaster C. L. Street, and a pleasant stopping-place at the City Hotel. The rain on Wednesday prevented my doing anything that required my leaving the shelter of the awnings; but on Thursday the weather was fine, and I visited most of the points of interest in the place. I also formed the acquaintance of Mr. Gilson, a former subscriber and a warm friend of the Press, who invited me to go with him on the following day to visit his mine, near Soulsbyville, which I gladly accepted.

Yesterday morning, at nine o'clock, found us in the saddle—Mr. Gilson, his partner (Mr. Pottredge), and myself—all well mounted, and in excellent spirits. Men and horses felt the invigorating effect of the bracing mountain air, and we bounded gaily along, scarcely noting the lapse of time until we were told that we had reached the mine, a distance of eight miles.

THE GILSON MINE

Is situated about half a mile from the village of Soulsbyville. It is worked through a shaft, which has attained a depth of 250 feet, having an inclination in that depth of only ten feet from a perpendicular. The rock is very rich, both in free gold and sulphurets, and seems to grow better as it descends. I have now a beautiful specimen of auriferous galena—a present from Mr. Pottredge, who showed me the works. The hoisting works are a model of perfection, the power being furnished by a steam engine of about twenty horse-power, and the whole so arranged that the engineer is able to empty the buckets into the car, attend the fires, and do everything that is required above ground, except propelling the car to the dump. Steam power is made to do almost everything, manual labor being reduced to the lowest point. After a pleasant hour at the mine, we remounted, and a ride of five minutes brought us to the mill of ten stamps, driven by a steam engine of 100-horse power. The mill was not running at the time, the bad weather preventing the hauling of quartz from the mine. I could not, however, avoid noting the solidity of the workmanship of every part, and the fine order in which all the machinery was found. Mr. Gilson remarked to me during the trip that the machinery of his mine and mill had been running for six years without any repair or alteration. This certainly reflects great credit upon the manufacturers and engineers. After a short, but instructive, examination of the mill, another short ride brought us to

THE EUREKA MINE AND MILL,

Located at the village of Summerville, which is pleasantly situated on an elevated slope, about a mile from the North Fork of the Tuolumne river, and ten miles from Sonora. Mr. Edwards, the gentlemanly Superintendent, very kindly showed us through the mill, and explained the working of every part. There are twenty stamps, of which, however, but fifteen were running at the time of our visit, one of the stamps of the fourth battery having been broken. They use at this mill a style of amalgamators which I do not remember having seen at any other place. They are of the pattern used in the gold mines of North Carolina, and have, at least, the advantage of being well tested; though from what I have seen, I hardly think they are equal to some of the more recent California inventions. The power for this mill is furnished by an overshot water-wheel, of sixty feet diameter—the most magnificent machine that I have seen in the mines of California. Two other water-wheels supply the power for hoisting and pumping. This mine has been opened to a depth of 550 feet, and is giving out—richer rock than ever before. Seven levels have been opened, on three of which the mine is now being worked, employing thirty-six men, and crushing thirty tons of quartz daily. Bidding adieu to our generous host, we re-mounted, and started for Sonora. My companions being in haste, pressed on to town, while I turned aside to visit the

SOULSBY MINE.

Here I was cordially received by the Superintendent, Mr. Inch, who, being busy himself, gave me in charge to one of the employés, a Mr. Bunnell, an intelligent New Yorker, who showed me through the works. The mine is owned by the same parties as the Eureka, and is worked on much the same principle. The employés are all intelligent and gentlemanly men, and gave me much information concerning the history and working of the mine, which time and space forbid me to give. This mine had been the scene of much costly and unsuccessful experimenting before it passed into the hands of the present proprietors, broken and worn-out machinery being scattered around in every direction. At present, they have a twenty-stamp mill, driven by water in Winter, and by steam in Summer, and pumping and hoisting works, driven both by steam and water power.

My grateful acknowledgements are due to Mr. Gilson for the pleasure afforded by the trip, and to the superintendents and foremen of the various mines for their uniform politeness and attention. D.

The Egyptian embalmers were great cheats. A mummy was unrolled in New York, recently, which the inscription on the coffin asserted was that of Tatis, "the young stranger on earth," son of Theme and Petbe, an officer of the Minister of Justice. The mummy proved to be that of a very old person. A mummy was unrolled in that city, several years since, which, according to the inscription, should have been that of a priestess, but proved to be that of a man. The old embalmers probably had many bodies at a time in process of preservation, and were not very particular which they returned, as the identity could not be established by friends.

Important Enterprise.—The Nevada Legislature has passed a bill granting to Mr. Sutro and associates a franchise to run a drain tunnel, the cost of which is estimated at $2,000,000. This tunnel, being calculated to drain the Comstock ledge to the depth of eighteen hundred feet, a lower depth than any mine in the known world has ever been drained, will require four or five years for its completion. Besides developing the entire range of country through which it passes, it will save many times its cost in machinery, wood and labor, now requisite to clear the several locations on that ledge from water, and reduce the cost of drainage of many of the largest mines on the Comstock range fully one half.

Water-killed.—Much apprehension is entertained among farmers in Napa Valley, (says the Napa *Recorder*,) that the late severe rains have drowned out all the grain planted on low lands which had not germinated at the time of their commencement. All the hills and rolling lands will unquestionably turn out large crops.

Written for the Mining and Scientific Press.

Metallurgy of Copper in California.

[By Prof. D'Hemry, M. D., Mining Engineer, Professor of Chemistry and Metallurgy, Superintendent of the Copper Mining and Smelting Company, Queen of Bronze, Oregon.]

NUMBER THREE.

CHOICE OF PROCESS.

Our intention is not now to publish an account of the different processes which are employed to extract copper from its ores. These processes vary much in different countries, and for sufficient reasons. The choice of the methods employed has been determined: First, by the nature of the ores; Second, by the nature of the substances which accompany the ores, both in the condition of their constituents, and in the condition of the mixed substances; Third, by the nature of the fuel which is at hand, by its abundance or scarcity; Fourth, by the different local considerations, or by the cost of labor.

The humid processes which are never employed, except when the processes by fusion are impossible, are not applicable in California at present; the substances which must be used as re-agents, are at too high a price, or the handling is too considerable where the re-agents are made in the establishment.

The English process is too long, too complicated and too costly in labor and in fuel, and demands too experienced workmen to be recommended. Besides, it cannot be employed except with the use of excellent coal at a low price, and the erection of a series of furnaces requiring an immense capital. This process is right in England, but has not been imitated anywhere else with profit, and never will be by sensible people, as long as the nature of ores will permit it to be dispensed with. In Europe they do not fear to augment the manipulations in order not to lose any of the metal which the ore contains—and they are right to do thus in Europe, since in so doing they find a benefit. But should the same be done in California where labor is high, where the capital invested is two or three times greater than in Europe, and where the interest of the capital is five times greater than in the old world? without doubt, no! and if we should servilely imitate Europe, on the Pacific Coast, we should inevitably be ruined. What matters it if we lose a small proportion of copper in the smelting, if this copper requires, for its extraction, an expense out of proportion to its intrinsic value? The methods of Europe are therefore not applicable in California, save in their principles, and they ought to be modified in their application according to the circumstances which surround us. It is for the engineer to ascertain what is the maximum of good products which he can obtain from the ors in question with the least expense.

It is in view of these economic considerations that we have chosen the German process, modified in the establishment at Boston, a process which we have changed some little ourselves for use in this country. We have been determined in our choice:

1st. By the nature of our ores which are almost all sulphurous, and contain no injurious matters; this process yields, however, good copper from impure ores, provided that antimony, arsenic, lead and phosphorus, are not in too great a proportion.

2nd. By the abundance of our timber which enables us to make excellent charcoal at a low price.

3rd and finally, by the high price of labor on this coast, this process exacting less labor than any of the others.

This process has for its object the reduction of all kinds of ores without distinction.

It is known—or if it is not known by any, it should be learned by them—that the oxyds, the carbonates, and some other more rare copper ores, smelted by mixing with them coal and some cinders, yield copper by a single fusion; but that, up to this time, metallurgy does not possess any practical mode of thus obtaining copper from copper pyrites.

Therefore since copper pyrites seem to be the only copper ores in California—the oxyds and the carbonates not appearing, except accidentally and as croppings—we have thought we ought to establish this fact in order to spare to those who are more zealous than practiced the trouble of announcing in the journals that they possess a new flux, or a new process, by which they obtain pure copper by a single fusion. As often as these ores will be oxyds or carbonates, those persons will have discovered but one thing, practiced, probably, since the time of Tubal Cain. If, on the contrary, their processes were applied to copper pyrites, they would have made one of the greatest metallurgic discoveries of modern times.

APPARATUS.

The apparatus which we are about to describe will suffice to reduce six tons of ore a day, and all our calculations and descriptions will rest hereafter upon the working of six tons yielding twenty per cent. of rosette copper. The apparatus consists of:

1st. The power to put blasting machinery in movement, and to crush a small portion of ore.

This blasting machinery should be a cylinder, and should send the wind through two nozzles of which the eye will have an inch and two-eighths of diameter, and another nozzle having an eye of an inch and a half, under a maximum pressure of an inch and two-eights of quicksilver, which equals, in round numbers, 600 cubic feet of air per minute, and a pressure of a pound and a quarter to the square inch. Water tuyeres will be used. The blasting machine should be provided with a regulator in order to maintain the wind at a uniform pressure an important point in all metallurgic operations. The regulater should have a manometer. The crusher need furnish but little ore crushed to the size at most of a small bean.

2d. Two low cupolas, constructed on the outside of stone or ordinary bricks, and lined in the interior with materials of the nature of fire bricks, and surmounted with chimneys.

The tuyere should be opened in the back-wall. The hight from the tuyers to the mouth, should be five feet five inches. The length from the forewall to the tuyere, thirty-one inches; the width from one side to the other twenty-six inches. The forewall has a thickness of only four and a half inches, made of materials in the nature of fire-bricks. The opening for throwing in the ore and coal, above the forewall, is forty-nine inches in breadth and thirty-nine inches in hight.

The crucible, below the forewall, has twelve inches of depth, and is made of a mixture of equal parts of quartz sand, clay and charcoal, and is called brasqus. The crucible extends to six inches in front of the exterior face of the forewall, and ends in a platform made of the same brasque, and is called fore-crucible.

The scoria flows freely upon the brasque from the fore-crucible, and on one side on the platform. The tap hole is made at the lower part of the crucible, and opens in front of the platform, where the basin is to receive the substance melted; this basin is made also of brasque. The tap hole is shut by a plug of clay which is broken, at each run of the metal, by the aid of an iron bar. The whole is constructed upon a foundation of brick or stone, in which are contrived canals for getting rid of humidity. The fastenings are of iron.

3d. Four kilns for calcining. They are constructed of bricks or ordinary stones, enclosed on three sides, and vaulted on the top. They communicate with a chimney, and are cemented with clay. Their length is eight feet; width, four and a half feet. The hight of the vault above the grate is six and a half feet; the hight of the grate above the ground is two feet. After the charge is introduced, the opening in front is shut from the grate to the vault with loose bricks.

These vaulted kilns, with chimneys, cost a little more than the open kilns used in Germany, but they offer a great economy of fuel and labor.

4th. A small German hearth. The construction of this furnace offers no peculiarity; its description is found in all the treatises on metallurgy. We will see, hereafter, that those who wish to produce only regulus or matts have need of but one cupola furnace. If they wish to produce black copper, two cupola furnaces and kilns will be needed, and, in fine, if it is wished to obtain rosette copper it will be necessary to add the small German hearth.

We will give here an approximate estimate, under ordinary circumstances, of the cost of the apparatus which we have just described:

Machines, Steam or Water	$1,200
Cylinders	1,000
Crusher	800
Two Cupola Furnaces	5,000
Small German Hearth	1,500
Different Utensils	1,000
	$10,000

It is necessary to add to this sum the cost of transportation of the different materials and machines, the sheds for shops and coal, of which the roofs should be of metal, and general expenses. It is impossible to estimate all that, on account of the variations which each locality must produce.

[To be Continued.]

COTTON AND THE BLOCKADE.—In reply to a statement made by Jeff. Davis that out of eleven thousand seven hundred and ninety-five bales of cotton shipped since last July from rebeldom, but one thousand two hundred and seventy-two were lost; per contra, the Washington *Republic* shows that seven thousand eight hundred and thirty-four have fallen into the hands of Federal cruisers during the time named.

IMPORTANT IMPROVEMENT.—The work of constructing the bridge across the waters of Mission, Bay from the foot of third Street on Steamboat Point to Point Avisadero, on the Potrero, was begun on Monday; it will be thirty-four feet wide and one mile long. This is one of the most important improvements yet undertaken in that portion of the city.

AMERICAN MILITARY WORKS.—It is said that the whole line of Gen. Grant's breastworks and fortifications, from the extreme left to the extreme right, is not less than thirty-five miles; and taking the sinuosities and the supporting lines into consideration, the whole works would measure nearly one hundred miles in length. This is the most formidable and extensive military work ever constructed.

OUR MEXICAN TRADE.—It is stated that the steamer California, of the P. M. S. Co., which left here some weeks since, understood to be with a view to open up a trade with Mexican coast ports, was not altogether successful in her mission, owing to the unsettled condition of Mexico. At last accounts, this steamer was at anchor in Acapulco harbor, and her captain came up here on the Panama steamer for further orders.

GOLD IN CONNECTICUT.—Dr Keith, the well known mineralogist, and the owner of a tract of land in Greenwich, Connecticut, has discovered upon it a gold vein, which he is at present actively engaged in mining. One piece alone of the precious metal was valued at over $600. The land in which this discovery was made was formerly mined for copper ore, a considerable quantity of which was at one time dug out.

SOME of the *elite* of New York are making an effort to reform the custom of late hours at evening parties, which they consider injurious to health and beauty. A new mode of invitation has been devised to convey a delicate hint of the new system: "Mrs Smith will be glad to receive her friends between the hours of eight and eleven."

WHEN Sherman made his advance upon Fort McAllister, the rebels burned a bridge, eight hundred feet long, to prevent his approach. In one night the bridge was re-constructed by Sherman's engineers, and the fort secured. This is an apt illustration of the mechanical skill that goes "marching on" with our armies.

HOW TO REMOVE OLD PAINT.—Soft soap mixed with a solution of potash or caustic soda, or pearlash and slacked lime, mixed with sufficient water to form a paste, is an excellent solvent for old putty and paint. Either of these laid on with an old brush or rag, and left for some hours, will render the putty or paint easily removable.

HOW THEY BURY THE DEAD.—The plan is now generally adopted in Grant's army, when burying the dead, to place in the grave with the body a sealed bottle containing a paper on which is written the name and other particulars respecting the deceased.

A lady in Machias, Me., cried out in her sleep, one night lately, that some one had cut her throat. She was covered with blood and on examination it was found that a rat had bitten the side of her neck and ear severely. The rat also attacked a child in an adjoining room.

AN IRON LETTER.—A late American mail, says the London *Times*, brought a letter, which is remarkable both as a documentary curiosity and as a specimen of manufacturing skill. It is written on iron rolled so thin that the sheet is only twice the weight of a similar sheet of ordinary note paper. The letter is dated "South Pittsburg, Pennsylvania, November 6th, 1864," and says: "In the number of your paper dated October 1st, 1864, there is an article setting forth that John Brown & Co., of the Atlas Works, Sheffield, had succeeded in rolling a plate of iron thirteen and a half inches thick. I believe that to be the thickest plate ever rolled. I send you this specimen of iron made at the Sligo Ironworks, Pittsburg, Pennsylvania, as the thinnest iron ever rolled in the world up to this time, which iron I challenge all England to surpass for strength and tenuity. This, I believe, will be the first iron letter that ever crossed the Atlantic Ocean.—Yours, &c., JOHN C. EVANS." The iron is said to be of exceedingly fine quality, and the sheet is by far the thinnest ever seen in this country. The letter will be deposited in the museum of the Midland Institute. Tested by one Holtzappfel's gauges, the thickness of the sheet is found to be the 1,000th part of an inch. A sheet of Belgian iron, supposed hitherto to be the thinnest yet rolled, is the 666th part of an inch thick, and the thickness of an ordinary sheet of note paper is about the 400th part of an inch.

THE MAGNESIUM LIGHT FOR THE MINES.—An extensive colliery firm is about to make a series of experiments, with a view to ascertain the applicability or otherwise of the magnesium light to the illumination of the underground working of collieries. In connection with the above it is interesting to learn that Mr. A. G. Grant, an English chemist, has ascertained, by careful experiment, that certain alloy, into the composition of which magnesium enters largely, are capable of affording nearly as brilliant a light as pure magnesium, and of colours varying with the metal mixed with it; thus, one part zinc and two parts magnesium produces an alloy which burns readily, and gives a slightly blue tinge to the flame; one part of copper and three of magnesium gives a green light; one part of strontium and two of magnesium gives a red light. Mr. Grant has already succeeded in burning twelve different metals in combination with magnesium, and in some cases has been enabled to diminish the expense of burning to one-third the present cost per hour. He anticipates that ere long magnesium will be produced as cheaply as zinc, and that it will then be thoroughly appliable to general illuminating purposes.

ELECTRIC PHENOMENA.—A letter from Owens River Valley says: "One thing worthy of notice is the electrical condition of the animals here—cats, for example. Take Pussy up in your hand, rub her gently down the back, and you will immediately feel a sharp ticklish sensation in the ends of your fingers, and sometimes smart shocks like the action of a galvanic battery. Of course you have a horse—no one can live here without a horse—go to him at night and pat him on his arched neck, rub him gently, and observe how the sparks follow your hand, like the phosphorescent light in the wake of a ship. There is a little black dog here—'Jip'—who is an electric wonder. When 'circles' were held at San Carlos, I suggested the propriety of inviting Dr. Franklin to call and see him. When you rub him in the dark, he blazes forth like an illumination. These exhibitions are to us both instructive and amusing, but to 'Jip' they must be annoying, to judge from the way he raises his voice and howls."

BENEFITS OF THE TELEGRAPH.—Admiral Fitzroy and his connection with the telegraph is now one of the wonders of Great Britain. He sits in his office near London, and every morning receives detailed telegraphic reports from all prominent points, regarding all the meterological phenomena of the day, and combining them he is enabled to predict with great accuracy the weather for the next day, and the next few days. This he does and telegraphs his predictions back for the guidance of mariners. Two days before a gale the admiral predicted its appearance from the north; the storm flag was hoisted, and every precaution taken. Sometimes of course he is mistaken, but as a general thing he is surprisingly correct. But that he can do this is certainly one of the great triumphs of modern meteorological science.

A VERY large bed-plate and fly-wheel were cast in Marysville, on Saturday last. These castings were the bed-plate, weighing 8,000 pounds, and a fly-wheel weighing 17,000 pounds, for a steam engine manufactured to order for Starr's flouring mill in Marysville, the engine to be of one hundred horse power.

MACARONI FACTORIES.—There are two factories in this city for the manufacture of macaroni.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, FEB. 11, 1865.

The money market is substantially unchanged and former ratee prevail—1½@2 per cent. per month upon unexceptional security. There is no lack of capital for legitimate business purposes and the tendency is to a still greater accumulation of unemployed means. Loans upon good mining stocks continne to be made at lowest bank rates without any difficulty if the margin from current market value be made satisfactory.

Receipts of bullion since Saturday last, amounted to nearly one million dollars. Gold bars have been taken to account by dealers at about 860. Silver bars are quotable at ½ to 3 per cent. premium.

The Share Market has been rather more active than for some time past, and some leading mining stocks have advanced materially. Recent developments in a number of claims upon the Comstock lode, are thought to be of a very flattering character, which has not been without its influence upon their current value. City shares are also in better request at enhanced rates.

Spring Valley Water Co., advanced to 95 per cent. on amount paid in, which, with assessment of $30 due to-day, is now $490 per share. This stock has risen within the past sixty days just about 50 per cent. California Steam Navigation was sold at 80½, and State Telegraph at 35. San Francisco Gas has risen to 84 bid.

Legal Tender Notes have been inactive thie week, owing to the absence of telegraphic communication with the East. Some $100,000 were sold within a range of 49c, seller 30, and 50½c cash, closing at 50c bid, 50½c asked.

Savage has been very steady, with little or no variation in price, 35 feet were sold at from $1,540 to $1,565, ex-dividend of $75 per foot, closing at $1,565 bid, $1,575 asked. Drifting continues from the prospecting shaft sunk from the lower level, and the indications would seem to lead to the conclusion that a very large body of ore will be found at this depth.

Gould & Curry opened at $1,550, was sold at $1,480, ex-dividend of $75 per foot paid on the 6th, then rose to $1,550, buyer 30, and $1,525 cash, and closed yesterday at about $1,565. The recent cave in this mine is said to have done no material damage. Receipts of bullion continue fully up to the the average of the past few months.

Yellow Jacket has been a conspicuous feature of the market and has attracted considerable attention, 112 feet were dealt in, steadily advancing from $1,050 to $1,500, and selling at the close at $1,480. We are informed that the drift from the lower level has penetrated a largo body of fine ore, north of the shaft, in hitherto undeveloped ground and that the prospects of the company were never so encouraging as at this time. The yield of the mine for the month of January is said to have exceeded $175,000 and for the current month, it is likely to amount to $250,000. A dividend is anticipated in March.

Belcher is well maintained at $1,025 bid, $1,050 ex-dividend. In the 260 feet level, at the end of the north west drift, the ledge has been stoped out for a number of galleries, and a mass of fine orc is now disclosed. In the drift at the lower level, the east wall of the lode has been reached in a number of places, presenting the same formation met with above, and containing seams of very rich mineral.

Challar is in less favor and 34 feet were sold declining from $950 to $750, and closing at $810, ex-dividend of ($10 per share) $40 per foot, disbursed to the stockholders yesterday. The mine is producing about 175 tons of ore per day and the face of the south drift is said to be materially improving. Some 3,000 shares of the stock of the Grass Valley claim have been purchased by this company and the suit of the Challar *vs.* Potosi, will probably be tried next week.

Potosi met with trifling sales this week, but is now held at $775. The company are prosecutiug their operations with energy, and are increasing the product of the mine. The suit of the Grass Valley *vs.* this Company, it is rumored, has been continued for the term by stipulation of counsel.

Empire Mill & Mining Company is inactive hut well held. Our information from the mine is of the most favorable character as to ite future productiveness. A dividend of $20 per share will be paid on the 15th instant.

Ophir opened nt $340, rose to $430, declined to $370, and sold yesterday at $365, 48 shares in all, changing hands. We learn that the new machinery being erected by this company, in connection with the Mexican, will be in operation at the end of tho current month. The trouble with water in the old Central shaft will no longer prevent the explorations and developmeuts contemplated by the new works.

Confidence (G. H.) is held at about $150 per share. The company's claim contains 100 feet, of 12 shares each, and it is thought will henceforth declare regular monthly dividends of $100 per foot. The main shaft is now down 450 feet, at which depth drifts communicate with the lode east and west to a distance of 100 feet. The west drift has penetratcd a large mass of ore, and east of the shaft the ledge is found to be 25 feet wide, containing rich sulphuret ore.

Imperinl is in better favor, and 193 shares were sold, advancing from $120 to $130 per share, and closing at $135 bid. The Rock Point and Gold Hill mills are reducing about 100 tons of ore per day. 3,400 tons were taken from the Alta grouud in the month of January. In the lower level, at a depth of 450 feet, drifts running north and west have disclosed a very promising lode of silver-bearing quartz. The Gold Hill Drainnge Company are now down some 30 feet below this level.

Uncle Sam has been quite active, at variable rates, declining from $280 to $265, advancing to $280, receding to $250, again rallying to $280, and closing yesterday at $350. During the week 180 shares have changed bands. Overman is in better request at $120 bid, $150 asked.

Hale & Norcross advanced from $240 to $260, and 22 feet were sold.

Burning Moscow has been in much better favor, the past few days, and rapidly advanced from $35 to $66, buyer 30—an assessment of $5 delinquent. At the close, sales were made at $61½@62. We can learn of no tangible reasons for the late rise apart from the strategic combinations of certain operators.

Sierra Nevada has been active, bnt in less request, 1,120 shares changing hands at rates declining from $22 to $11, and closing at $13. An assessment of $7½ was levied on the 4th inst.

Bullion declined from $70 to $60, within which range 155 shares were sold. This company have drifted, it is supposed, within 50 feet of the Challar line, with streaks of good ore, improving the further they go north.

Nevada (J. G.) rose from $36 to $40; North American was sold at $15; Wide West rose from $6 to $8, and declined to $6; Bajazet and Golden Era was dealt in at $3.

The aggregate sales of stocks and Legal Tender Notes since Saturday last amounted to $555,080.

[ADVERTISEMENT.]

To the Public, and to Millmen in Particular.

As Thomas Varney has not, up to this date, withdrawn his notice in the "Mining and Scientific Press," in which appears the following language:—

"All persons are warned against purchasing machines made at the Miners' Foundry, called 'Wheeler's Amalgamators,' as they are an infringement on my patent, and a suit is now pending in the United States Circuit Court, against the parties infringing;"

In justice to myself I am compelled to give to the public a statement of the facts in the case, and show the position which Mr. Varney and myself occupy as Patentees. He commenced suit against me, and the Miners' Foundry, for $20 000, about the 1st of March 1863, and threatened suit against any and all persons who should buy my amalgamators, thus greatly damaging my business. To show the injustice of this suit against a "poor hard working mechanic," I will quote from the opinion of Judge Hoffman, as rendered in the case last November. He says:

This is an action for the infringement of a patent issued to the plaintiff on the 16th of December, 1862, for an "Improvement in Amalgamators for gold and silver." The machine alleged to be an infringement has also been patented—the patent being dated December 8th, 1863. The defendants deny the alleged infringements, and the novelty and originality of the plaintiff's invention. They have also given notice, under the statute, of various other defences, hereafter to be noticed.

Models of the two machines were exhibited in Court, and a large number of witnesses called to explain their construction and mode of operation. It is apparent that the patented machine of the defendant closely resembles, if it be not substantially identical with, the improved and modified machine now manufactured by the plaintiff. But the inquiry is not whether Wheeler's machine resembles that lately used by Varney, but whether the former is substantially the same as the machine described in Varney's patent. That Varney has, in many important particulars, modified the machine as described in his patent, is obvious. Indeed, his late machines resemble much more nearly in external appearance, and in their mode of operation, the Wheeler patented machine than they do a machine constructed according to the drawings and specifications of his patent.

After describing Mr. Varney's pan and its operation, the Judge says:

It appears, however, that the idea of working ores in a batch, by causing them to pass repeatedly between mullers, the upper one of which is provided with openings at the center, is by no means novel.

J. E. Clayton testifies that, so long ago as 1845, he arranged a machine in Tallahoosa, Alahama, for the reduction of gold ores, which embodied substantially the same principle.

* * * * * * *

In Overman's Metallurgy, p 267, a similar arrangement is described. * * * it is evident that the author is here describing an existing and well known machine, the usefulness of which has already been ascertained.

It is also apparent that the result aimed at is the same in this machine as in that of the plaintiff, and that the means adopted to accomplish it are substantially similar. In both machines the pulverization of the ore is effected by means of a bed plate upon which a muller rotates, with central openings to permit the pulp to pass continuously and repeatedly between the grinding surfaces until the operation is completed.

Amongst other things the Judge quotes the following from Judge Story:

But in all cases where the patentee claims anything as his own invention in his specification, Courts of law cannot reject the claim, and if included in the patent and found not to be new, the patent is void, however small and unimportant such asserted invention may be.

* * * * * * *

Here the plaintiff claims a particular position of machinery as his invention, and it clearly appears in evidence that the position is not new. It has existed before—not in machines exactly like the present, but in machines applied to analagous purposes, viz: in machines applied for the same purpose as the plaintiff applies them. The objection therefore, is fatal.

In the defendant's machine, the pan in two parts, provided with flanges, packing, &c., to which the plaintiff in his patent attaches so much importance, is not used, but a deep pan is substituted with a wooden cover.

The arrangement of the slots or shoes on the muller is different. The upper muller is provided with spiral ridges arranged to operate with similar ridges reversely inclined on the inner surface of the pan, to raise the pulp and promote the circulation. The upper muller is attached to the shaft by an universal joint, and by a mechanism quite dissimilar to that described by the plaintiff. And for the scrapers are substituted broad guide plates extending and secured to the edge of the pan, and capable of being elevated or depressed by means of a mechanism not found in the plaintiff's machines.

Assuming then—as in the point of view in which we are considering it we must—that each of the several parts of the plaintiff's machine is old, and not separately patentable, it seems clear to me that if the patent for the machine can be sustained, as for a new combination; which I think doubtful, the combination of the defendant is at least as novel as that of the plaintiff.

We have already seen that the muller rotating upon a bed plate, with coutral openings, and arranged in a pan so as to create a circulation of the pulp, is not a new invention. The tub, composed of two parts, with flanges, packing, &c., is not claimed to have been used by the defendant. In fact it is now discarded by the plaintiff, and a deep pan, with muller attached by an universal joint, has been adopted by him in his later machines. The infringement, if any, must consist in the use by the defendant of the scrapers described in the plaintiff's patent.

The inquiry thus arises—are the curved plates described in Wheeler's patent, substantially the same in their structure and operation as the scrapers of the Varney patent, and if so, do the latter constitute a "material and substantial part of the things patented by Varney, definably distinguishable from the other part." To determine this question, a brief description of Wheeler's machine is necessary.

The Judge then describes the Wheeler pan and the Varney pan and scrapers, and says:

In the Wheeler pan four plates are used while Varney employs only two scrapers. The form or curve given to these plates in both machines is similar, though not identical; but in their structure, arrangement, and the use for which they are intended, there is an essential difference. The scrapers of Varney are represented as of inconsiderable width, and extending from a ring at the center to the periphery of the muller—they rest apparently upon the surface of the muller, and no means of elevating or depressing them are mentioned in the specifications or exhibited in the drawings:

The plates of Wheeler are of considerable width, and attached to a frame suspended from the top of the shaft, resting upon a vertical screw, by means of which the frame and plates attached to it may be elevated or depressed. The plates extend to the inner surface of the pan, where they are secured by slides. The office of these plates, as described in Wheeler's patent, has already been mentioned. It appears to me that the scrapers of Varney neither serve, nor were intended to serve, any such purpose. [Here the Judge gives his reasons for the above opinion.]

For these reasons I am of opinion that the curved plates of Wheeler differ from the scrapers of Varney in their form and arrangement, their object and effect, and that therefore their use is not an infringement of Varney's patent.

Much testimony was taken to show that in fact Wheeler's invention was prior to that of Varney's and that the latter derived his ideas from the former.

It is claimed by Varney that his invention was, in its essential features, matured and perfected in August 1861 that this statement seems hardly consistent with his declara tions or his conduct.

Varney's application for his first patent was not made until the end of October, 1861. That machine has since been discarded as useless.

If then, at the time of this application, he had already matured and perfected the invention of another and far better machine, he committed a practical fraud upon the public in withholding from them the benefit of his skill and ingenuity. It is certainly strange that he should have gone to the trouble and expense of procuring a patent for his first machine, and delayed, for nearly a year, his application for a patent for the improved machine which he had, as he says, already invented.

It may well be doubted whether, if it be true as Varney states, that at the time of his application for his first patent he had already completed and perfected his improved machine, the suppression would not be fatal to both. It appears in evidence that, so early as December, 1861, Wheeler had conceived and communicated to Stewart & Kirkpatrick at Washoe, the idea of his machine. He explained to them the mode in which the circulation, or over and under current was to be produced, and the guide boards by which it was to be assisted.

In January, 1862, drawings of this machine were received at the Miner's foundry, and Stewart, the partner of Churchill, was desirous of having his pans constructed on that plan. The theory and construction of the proposed pan were fully explained to Varney, who succeeded, however, by affecting to consider Wheeler's pan a "humbug," in dissuading the parties from adopting it, and in inducing them to order pans made on the model of his own patent. These were subsequently discarded as useless. We are driven to adopt one of two suppositions; either that Varney willfully deceived Stewart in inducing him to order an inferior pan, or else that he had not at that time discovered the mode of producing the over and under current, recognized its utility and invented a machine to effect it.

Wheeler commenced manufacturing his machines in January, 1862. He commenced using them in June of the same year. They were constructed at the Miners' Foundry by the defendants to this cause, under the immediate observation of Varney. But in his conversation with Scott, in July, 1862, and in his communications with the defendants, he does not appear to have intimated that he was the first inventor of the Wheeler machine, and that in constructing the latter they were violating his rights. Up to the end of 1862, he continued to have his own pans built at the same foundry; and if he really considered the construction of Wheeler's pans to be an infringement of his own invention, his silence is inexplicable. His delay in applying for his second patent is equally unaccountable. In August, 1861, he had, as he says, completed and perfected his invention of his improved machine, and yet in October of that year he applies for a patent for his first and imperfect invention, and delays his application for a patent for his improved and perfected machine until the end of June, 1862—more than a month after Wheeler had taken the preliminary steps to obtain his patent.

It is unnecessary, however, to pursue this inquiry further, for in the view I have taken of the case the question of priority of invention is immaterial.

The Judge then notices the other grounds of defence, and says:

If this view of the effect of that statute be correct, it affords a defence to Wheeler as well as the other defendants. It is not pretended that he has used any machines not manufactured by them, or that he has infringed the plaintiff's rights, otherwise than by receiving from the other defendants the sum agreed to be paid by them on the sale of his machines.

I find, therefore, for the defendants.

[In this candid statement to the public, I should have preferred to have given the decision of the Judge and the findings of the Court in full, but for the great length of space they would occupy; and I will state that the same can be found in the "Mining and Scientific Press," of December 10th and 31st, 1864, and invite their thorough perusal.]

It will be seen by the above statements that Mr. Varney is infringing on my patent right by the use of wide guide plates in his pans, instead of my infringing on his patent. The truth is, he never used any but narrow scrapers in his pans until after I had put my pans in operation, and they had proved a success. None of his pans made prior to the year 1863 ever run six weeks without being condemned and thrown aside. This may account for the fact that he afterwards altered his patterns and made them like mine, with an open, deep pan, and wide guide plat s instead of scrapers, and put a wooden cover on the pans.

Having established my right in my patent Amalgamator, it is now my turn to protect myself against the infringement of "Mr. Varney, or any other man," and I intend to do it; and all persons are hereby warned not to purchase or use machines called "Varney's Amalgamators," as made at the Union Foundry, Pacific Foundry, or any other place, as they will make themselves liable for an infringement on my patent right.

Having made some important improvements in my Amalgamators, the public are invited to call and examine them at the Miners' Foundry, San Francisco, or at Prescott & Schiedel's Foundry, Marysville, where they are manufactured ZENAS WHEELER.

San Francisco, Dec. 27th, 1864.

Astonishing Illegality of Mining Advertising.

The amount of mining corporation advertisements now being published in certain daily papers of this city in an illegal manner, and containing plain and gross violations of the recent Act concerning assessments of corporations, is really astonishing.

ADVERTISING IN SUPPLEMENTS has been decided by the Courts of the State of New York (after whose code the laws of California were framed,) as absolutely void; and we have the best of reasons for cautioning every prudent company against that class of advertising. Furthermore, there are continually numberless errors or discrepancies occurring, through MISAPPREHENSION OF THE LAW, on the part of advertisers.

We do not aim to raise unnecessary alarm, but simply perform our duty in admonishing parties interested against the storm of retribution, which is most surely awaiting the success of such companies as are now pursuing informal transactions, whether the same occur through carelessness, duplicity or ignoraace.

The original bill for levying and collecting assessments, as first introduced before the last Legislature, we denounced as outrageous; as amended and passed, the Act is obnoxious and cumbersome to the mining community, and is rapidly preparing an enormous feast for the "legal frateraity" of this coast. Although very rigid, the law is no less specific in its main featnres, and when once minutely understood, its illiberal requisitions are very plain.

1852. 1865.

Thirteenth Year of Publication.

THE GOLDEN ERA,

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty six columns containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in the Golden Era.

The most popular Novels of the present day are published as Serials, from week to week, in THE GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the Contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California, and on the Pacific Coast; also correspondents and contributors of distinguished talent in the Atlantic States and Europe; including "Orpheus C-Kerr," Fitz Hugh Ludlow, G. B. Densmore, "Mark Twain," Dan De Quille, Florence Fane, Miss Emma Hardinge, Sarah E. Carmichael, Annie E. Fitzgerald, "Occasia Owen," Alice Mason, William Simpson, Chas. F. Stoddart, "Ina," H. C. Willistou, "Albion," "Fairfax," Bonnevol, Mary Kyle Dallas, Margaret Hosmer, and many other accomplished writers of Fiction, Romance, Novels and Stories, Poetry, Essays, Sketches, etc., etc., comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States or Europe.

Subscriptions to be Paid in Advance.

ONE YEAR $4. SIX MONTHS $2. THREE MONTHS $1.

Take care to write distinctly the name of the person; the name of the city, town or locality where the Post office is situated, and the name of the County and State, in order that the paper may be fully and accurately directed to every address.

THE GOLDEN ERA TO CLUBS.

Parties (living remote from localities where agents are located) forming a club of five yearly or half-yearly subscribers, and forwarding the subscriptions (by letter registered and postage paid) to the office of publication in San Francisco, will be entitled to an additional copy of The GOLDEN ERA for the term of one year, or to retain the equivalent in cash.

AGENTS in every part of the State receive subscriptions for the GOLDEN ERA.

POSTMASTERS in California, Oregon, and neighboring Territories, obtaining subscriptions for the GOLDEN ERA and forwarding the same, with name and address of the subscriber, will be allowed a commission therefor.

PARTIES residing in localities where no Agents are established will forward their subscriptions by mail.

SUBSCRIBERS will be careful in writing as plainly and fully as possible, the direction of papers to be sent to any part of California, the Atlantic States, or elsewhere.

Now is the Time to Subscribe.

TO ADVERTISERS!

Best Advertising Medium—The "Golden Era" is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village, and mining and agricultural precinct in California, and offers unusual and unequaled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as these of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

GOLDEN ERA POSTAGE.

POSTAGE on the GOLDEN ERA, to Mail Subscribers, in California and throughout all the States and Territories of the Union, per quarter, (3 months).... 5 cts. To be paid quarterly, in advance, either at the Office of Mailing or Delivery.
POSTAGE on the GOLDEN ERA, Single Copies, transient, to be prepaid by stamps..... 2 cts.
POSTAGE on the GOLDEN ERA, to Mail Subscribers in the county (San Francisco) where published..... Free.

TO MINERS AND MECHANICS.

The publishers of this paper are making great efforts to establish, for the benefit of miners and mechanics, a journal which shall occupy on the Pacific coast a similar position to that filled by the *Scientific American* and the *American Artisan* in the Atlantic States. Our isolated position and peculiar necessities appear to require a journal quite distinct, in many particulars, from similar publications at the East. To meet this want we have established the MINING AND SCIENTIFIC PRESS. Here the miner, the mechanic, and the man of science, find themselves brought in closer contact and more dependant, each upon the other, than in any other locality on the globe. Hence we have endeavored to present this paper to this community of interest as a representative journal. In order to carry out the plan of our work as it should be done, we greatly need the assistance and co-operation of those for whose benefit it has been established. Every miner, every mechanic and many men of science to whose attention this paper is submitted, or who may, as a regular subscriber or by casual circumstance, hold this paper in his hand, should show it to his friends—the miner to his fellow-miners and the mechanic to his fellow-mechanics—and do what he can to induce them to join him in the support of a journal whose measure of usefulness will be in proportion to the liberality with which it is supported. The press, throughout the State, and the public everywhere, so far as we are informed, recognizes the value and importance of the MINING AND SCIENTIFIC PRESS to the great interests in California, to whose advancement it is pledged. It has now reached its tenth volume, and is established on a firm basis. Its publishers are desirous of still further improving its appearance and usefulness. Hence this appeal to its friends. The paper has just entered upon a new volume and the present affords a most favorable opportunity to commence your subscription. Numbers have already come in, since the commencement of the new volume, and we hope to add many more to our list ere we reach the close of another quarter. No better investment of money can possibly be made by the miner or the mechanic. The information contained in one volume of this paper is of many times more value than the cost of subscription—and worth far more than the information which the same amount of money will purchase in books.

Memorandum for Secretaries.

Safe Rules for Advertising.

Make your order levying the assessment on any day EXCEPT FRIDAY, and advertise the Assessment Notice on the FIRST FOUR succeeding SATURDAYS, setting the day for delinquent advertising on the FIFTH SATURDAY, and the day of sale on the SEVENTH SATURDAY, or any day thereafter, PREVIOUS to the EIGHTH SATURDAY.

ADVERTISING IN THE INTERIOR.—If the mine or works of the corporation are located in any State or Territory of the United States, notice must be advertised there also, if a newspaper is published in the same county. On this account, SATURDAY is the best day on which to levy assessments, as thereby the longest period possible is gained for transmitting a copy to interior papers, which are usually published on Saturdays.

POSTPONEMENTS.—The date set for advertising delinquent stock, and the day of sale mentioned in either notice, may be *once* postponed for any period not to exceed ten days. Secretaries can avail themselves of this privilege when assessments are levied on Friday and they are obliged to advertise at the mine on Saturday, or desire to publish on that day at the place of incorporation.

ERRORS, OMISSIONS, OR DELAYS are definitely provided for in Section 14 of the new law, whereby it is plain that, if the advertising is delayed, the Secretary can only fix the dates for delinquent advertising and sale to suit the time he is to advertise, and proceed anew.

WHEN PAYABLE.—It is the usual custom to make the assessment "payable immediately," or upon some date within a day or two from the time of levying the assessment, although the law makes no requisition as to this matter.

BLANKS FURNISHED FREE to advertisers in the MINING AND SCIENTIFIC PRESS, for Assessment Notices, Delinquent Sales, Postponements, etc.; also copies of the Assessment Law of 1864. Copies of advertisements, for sending personal notice to shareholders, printed at $1 per hundred.

The PRESS is the most ECONOMICAL advertiser for stockholders, reliable and obliging for Trustees and Secretaries, and merits the patronage of the mining interests.

Mining Summary.

CALIFORNIA.

From every poiat we still eontinae to hear favorable aecounts; water being abundant, the miners are fully improving their opportunity, and working witb a will, vigor and sueeess, rarely if ever witnessed at any previous season. Very few idlers are now fonnd about the mines, and while all hands are busy gatbering in the golden harvest, money matters are everywhere becoming sensibly improved, and business men once more look smiling and hopeful. This state of things may he expected to continue, even should bnt little or no rain fall for tbe balanee of the season; as the rivers and reservoirs are aow everywhere filled, the grounds thoroughly saturated, and the great summer reserve, of snow on the mountains, is piled up to a most satisfaetory hight.

Shasta County.—The fact that Shasta Conuty abounds in anriferous quartz seems now to be very generally conceded. In addition to tbe leads already developed, new ones are constantly beiag opened. The Highland Guleh is proving itself very rieh ia gold bearing quartz. There are two mills there, botb paying well.

Tbe Highland mill, a small one, according to the *Courier*, cleaned up for the ten days previous to Jannary 16th, at the rate of $400 per day; for the ten days previous to ths 27th ult., the elean up averaged $368 per day. No exact accounnt is given of the Wasbington mill; bnt its results are prononaeed quite satisfaetory.

Messrs. Scammon & Co., have reeently located a lead near the center of Sbasta which bids fair to yield a fortnae to tbe owners. The Spring Creek eompany bas not yet been able to get ont sufficient rock to keep their mill running regularly; but tbe yield of what has been taken out, up to the present time, is said to be perfeetly satisfaetory. The Mammoth Company appear to be short of water for rnaning their mill—a great oversight. Their mine is said to be rich beyond question. Then why not pnt up steam power?

The Bully Hill Company, says the Red Bluff *Independent*, has struck a vein of copper ore which is said to assay fifty per cent. in copper, besides being rich iu gold and silver. Much excitement was created by the discovery, and "feet" went up to "twenty." L. A. Kelly has started his mill, the first in Copper City, and is working "Original" rock, aad if it pays one-half wbat every one is confidcat it will pay, there will be no more assessments ia this company. It is claimed that Pittsburg is coming ont all rigbt. A little more time is asked for its development.

Plumas.—Tbe Butte Bar Company's new mill, says the Quincy *Union*, will be ruaning by the first of April. The company owning the placer mines near Spanish Ranch, lately discovered, are sinking a shaft with most flattering prospects. Tweaty-five ceats to the pan is often obtained, and pieces of gold weighing from one to three dollars have been fonnd in the ground. This ground is supposed to be a continuation of the Badger and Gopher Hill claims.

Sonora.—The Sonora *Democrat* learns tbnt the mill of the Nonpariel Gold Mining Company, under tbe management of A. Du Prat, Esq., and situated on Dan Flat, is a complete success. The mill is run by the improved Turbine wheel, and "works to a charm." The rock pays well. Thirty-five tons of their rock has been crushed, wbich yielded about $2,000. With their excellent machinery, and the new amalgamator. rock which was deemed almost worthless is yielding $20 to tbe ton. The sueess of this mill will doubtless stimulate enterprise in otber quarters. The management of the mill is in the hands of Mr. Babcock, of San Francisco, who is said to be a practical and efficient worker in ainerals.

Sonoma.—All other mining excitements having about died out in these parts, says the Sonoma *Democrat* a revival of the Quicksilver mines in the vicinity of the Geysers is being made. Fine specimens of cinnabar from the vicinity of the American mine have arrived in town withiu a few days past, and new locations are being made.

The *Democrat* learns from the Secretary, that the Olive Copper Mining Company, are shipping good paying ore from their mine on Russian River to San Francisco.

Los Angelos.—The *News*, without stopping to give us any reason therefor, expresses the opinion that the work of one year more will place the mines of Southern California upon the list amongst the richest mines which have ever been worked ia the Pacific States or Territories.

Trinity.—We condense from the Trinity *Journal* the following items: Gold dust begins to come in plentifully. Black recently purchased over 400 ounces, and it has been coming in steadily to others. Captain Kelton brought up about 120 ounces from Douglass, the wasb-up of only three days. Water has been turned into the new ditch of the Turner Bar Company, and Smith's Flat is melting away at a rapid rate.

Good news comes from Gibsonville. Fred. Leach cleaned up $400, for one week's run. He was astonished at the yield, for the claim was pronounced "worked out" years ago. Other claims in the vicinity are yielding handsomely.

All is life and activity at Junction City. Philbrook & Tye's new ditch, one of the finest in the county, is finished as far as Daey's raach.

Sierra.—The Independenes quartz mill, at Sierra Butte, lately cleaned up, after a run of twelve days, the nice little snm of 156 ounces of gold—$3,000.

Tbe new mill in Slug Cañon has recently been started. It is under the charge of Capt. Blunt, and is said to be a very fine one of five stamps. We have no results as yet. The mine upon which it is erected, says the *Messenger*, is an old one, ont of which some $45,000 were taken with an arastra some years since. Tbere is rock enough in sight to supply the mill for a long time; and if it pays as well as is expected, will yield a handsome return for the money invested.

The American Company, at Morristown, have suspended operations for tbe present. They paid off tbeir haads—a thing quite unusual with hydraulic companies at this season. They took out between $3,000 and $4,000.

Yuba.—The Pennsylvania Company, in Brown's Valley, lately struck a new ledge, much wider and richer than the one they have been working. It was fonnd by running a tunnel from their main shaft some fifty feet to the west. It is supposed that this ledge runs through the Jefferson and all the claims on the same line.

The Yuba Company will soon build a new mill. The stock is entirely owned by San Francisco capitalists. The *Appeal* thinks there will be more than one new mill erected at Brown's Valley this Spring. Undoubtedly the Pennsylvania Company will be forced to enlarge theirs, as its crushing capacity is not on a scale with the working of the claim. Other interests will be developed, and fall into the hands of parties with means to make them productive.

El Dorado.—The Sacramento *Bee* says that a boy at White Rock Station, seven miles from Folsom, took a notion to prospect a little for gold, a few days since, and commenced panning out some dirt a short distance from the Station. In a few hours he panned out about $15. A day or two since, a couple of carpenters at Latrobe washed out $75 worth of gold in a short time.

Nevada County.—The Nevada and Grass Valley papers are still daily giving interesting items of "new discoveries," "strikes," "large yields," etc. A most wonderful degree of activity and success appears to characterize that famous locality. The chief excitement in Nevada, during the past week, has been the Pennsylvania Company, located at the west gap of the Sugar Loaf. The *Transcript* says their new mill will be ready to start the coming week. As soon as the mill commences crushing, and the result is known, it will most assuredly astonish everybody in this part of the county. An interest of 100 feet was sold three months ago for the paltry sum of $250, and now an interest cannot be bought at any price. The only reason it was sold was simply because the owners were very poor, and felt they were unable to prosecute the work without some money. There are four owners, all strangers to us, except Sam. Oates. They alone have run a tunnel 900 feet in length, and have taken out a large lot of splendid quartz.

The Big Tunnel Co., just above the French mill, have struck a ledge which assays $50 per ton.

A lot of rock from Eddy & Co.'s mine, on American Hill, is being crushed at Palmer's mill, which indicates a large yield.

Messrs. Eddy & Co. recently cleaned up from their hydraulic claims, at French Corral, $32,000 from a two weeks' run.

Mr. William Hazlet has recently struck a rich lode on Cement Hill, which prospects, by band-mortar work, at the rate of $100 per ton.

The Grass Valley *Union*, of February 2d, says that Messrs. Davis & Coe have commenced the erection of their mill on the Day lode. They will do enstom work as well as their own. These gentlemen have much experience in such matters, gained in Washoe.

John Dennon, Reuben Leach, and others, have made a new discovery, which promises well. The ledge is situated on Smith's ranch, about one mile southerly from Grass Valley, on the old Auburn road.

The Union Company, on Little Deer creek, a short distance from town, according to the *Gazette*, cleaned up $8,640 on Saturday last for one week's crushing. The owners of this lead are taking out from twenty to twenty-four tons of quartz per day. This lead has only been worked a short time, hat they have already takea ont a fortane, and there is no probability tbnt the yield will decrease for some time to come.

Capt. Lee is taking out some fine rock from the Ophir Hill mine. They have a three foot ledge.

Mr. Frank Ruanels struck a very promising lode, a few days since, while working in his garden, on the hill east of Boston Ravine.

According to the *National*, the Potosi Co., owned by Wm. Thomas & Co., a few days since, turned out over $4,000 for one week's run.

The "good things" in Nevada county are not altogether confined to the two principal towns mentioned. The precious metal seems to be scattered promiscuously all over the county, as we judge from the following items gleaned from the several county papers mentioned:

There are fourteen hydraulic companies in the neighborhood of Bloomfield now in active operation. Wm. M. Beck has thirteen men at work in his claims, and is now engaged in running a drift for a grand blast, in which he contemplates using sixty-five kegs of powder. When he cleans up, a handsome result is expected. McCullough & Co. are engaged in "stripping," and after they get to washing their "pay dirt" expect to take out lots of dust. The top dirt pays $6 a day to the hand. Bush & Co.'s diggings are paying $8 per day to the hand, clear of all expenses.

The miners at North Bloomfield have great difficulty in working their claims, being unable to obtain a sufficient fall; but the Eureka Lake Company propose running a tunnel, the coming Spring, into Humbug creek, which will give them a fall of sixty feet. If this tunnel is run, and there does not seem to be much doubt about it, a great deal of mining will be carried on there next season.

Miners in the neighborhood of North San Juan and down the Ridge are represented to be doing exceedingly well—taking out more money than ever before.

The Golden Gate Company, after a run of thirteen days, recently cleaned up $12,000. For the last sixteen months this company has been engaged in running a tunnel, and two weeks ago the famous "blue lead" was struck, with the foregoing result.

Reports of successful mining come in from Columbia Hill. The Dutch company take out from $3 000 to $4,000 per run of ten or twelve days. The Union Company are doing well. The Lake Company, near Cherokee, take out in the usual run of twelve days from $3,000 to $4,000. Gilroy & Co.'s claims have paid well, and promise better. Still greater prosperity is anticipated when warm weather comes.

A large number of claims near Cherokee, are also being worked, and great quantities of gold are being taken out. The Eureka Lake Company are said to be taking large amounts out at each "clean up." Considerable interest is also manifested in quartz, at that place. Several leads are being prospected in the neighborhood, and the owners hope for good results.

ESMERALDA.

The Esmeralda *Union* of the 25th ult., says that a little over seven tons of rock from the Osceola ledge, Montgomery district, was brought to Aurora last week and crushed at one of our mills. It was third class ore, the company having twice overhauled it for the purpose of selecting a ton of the choicest for shipment to San Francisco. The average yield per ton was within a fraction of $96, and was perfectly satisfactory to the owners of the lead. It is believed by some that from every twenty tons of ore taken out of the Osceola claim one ton can be selected whose yield will not fall short of $8,000.

Several tons of Cortez rock, crushed last week at the Bodie mill, yielded $200 to the ton. This rock was sold by the Cortez company for $5 per ton, the purchaser taking it out of the mine and hauling it to the mill.

We find the following item in the *Union* of February 1st, with regard to the Wide West:

On Thursday evening last, John F. Pope, Esq., Secretary of the Wide West Company, arrived in this city by the Carson stage. On the day following he notified the hands in the mine and mill that after Saturday their services would not for a time be required, as the company purposed to stop ths mill for repairs. Accordingly, on Saturday evening the men were discharged, but not receiving their wages they took forcible possession of the mill and mine, and are now all at work. It is the intention of the miners, nnless sooner paid by the company, to pay themselves out of the mine. As the affairs of the company are by no means in a bad condition, the difficulty will soon be settled. It will require about two months' time to repair the mill, during which work in the mine will be suspended,

HUMBOLDT.

The Hamboldt *Register* says that the Trinity, Whitmore, Sheba and De Sota, are all at work with rich prospects ahead.

Work has been commenced again on the Butte, in Santa Clara; also on the Little Giant, in the same district.

The citizens of Star district, according to the *Register*, have New York on the brain very badly, and many of them are richer in imagination than the first settlers were in '61. A great many companies have been fixed up for the New York market. The most of the ground lies in Pine Hill District. There are said to be some very rich ledges there, showing fine mineral.

Several persons have left Star for Boise, expecting to stop at Jordan Creek till the Spring opens. Quite a number are going to Paradiss Valley. The weather there is very pleasant, and a great many are plowing for barley crops, which they expect will be very large.

The Seminole Tunnel location was recently made by some of the oldest settlers in the county, with the purpose of offering such inducements as would secure the aid of foreign capital in the development of mines covered by the claim. The location for a tunnel has been judicionly made, the line cutting the mountain from Eagle Cañon in a direction to pass, at a great depth, through unclaimed portions of a large number of the best ledges in this district.

The *Register* says the great canal in that county has not been viewed by many in the light of an agricultural benefit. Crossing a sixty-mile sweep of rich bottom land, bringing the whole body of the Humboldt river through by a cut-off, which secures in less than sixty-miles all the fall which nature required in two hundred miles of river, this work will repay in agricultural benefits along the entire cost of construction. The large tracts of land, now producing nothing but sagebrush, which most writers have styled an irreclaimable desert, are found, by irrigation, to be capable of golden harvests. It has been so proved along the Hamboldt Canal, from which water has been turned upon these waste places. No better ground for vegetables and cereals can be found.

Now in its Tenth Volume!

—THE—

Mining and Scientific Press,

—THE MOST—

Profitable Newspaper

—FOR THE—

Readers of the Pacific Coast.

Issued Every Saturday Morning,

DEWEY & CO., Publishers.

Our Journal enters its Tenth Volume with marked prosperity and improved facilities and resources for furnishing a handsome, valuable and well filled sheet.

We believe that the Press furnishes more information of ready application and intrinsic value to its readers than any other journal on this side of the Continent. Its circulation has doubled during the past year, and, for the economy and interests of the industrial classes of this and neighboring States, its subscription list should be more than trebled for the ensuing twelve months.

We shall continue to make the Mining and Scientific Press substantially

An Instructor to Prospectors,
An Economist to Millmen,
An Assistant to Active Miners,
An Economizer for Mining Advertisers,
A Reliable Reporter for Shareholders,
A Faithful Monitor for Stockdealers,
An Intelligencer for Mechanics,
An Incentive to Inventors,
A Reflector for Patentees,

And a Helpmeet to all Industrial Classes

Upon the Pacific Coast. We shall give accurate and frequent

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

Friends pleased with our efforts in the publication of the Press can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

SUBSCRIPTION IN ADVANCE.

One Year, (two volumes)..... $5.00
Six Months, (one volume)..... 3.00

It is Impossible for editors to know all the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventions can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions or machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:
Saturday Morning, Feb. 11, 1865.

Canvassing Agents.

We would call attention to the following named agents of the Mining and Scientific Press as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the Press, will be acknowledged as a personal favor to us:—

Wm. R. Bradshaw—San Joaquin, Calaveras, Merced, Tuolumne, Stanislaus and Mariposa counties.

Mr. Robert Lattimore—Butte and Yuba counties.

J. M. Wolf—Sacramento, Placer and El Dorado counties.

A New Quartz Mill for Dry Crushing.—Messrs. Strong & Rounds, of this city, have recently invented a new machine for dry-crushing quartz, preparatory to amalgamation, which they have denominated "The Eugine Battery." The objects of this invention are—First, to combine in a machine of one stamp the effective working capacity of a five-stamp battery, of ordinary size. Second, to prepare the ore much more perfectly for amalgamation. Third, to lessen the labor of the operator. Fourth, to free the mill from any dust liable to injure the health of the operator. Fifth, to present, in its construction so little weight so as to render it easy of transportation to the mountains on mules; and, Sixth, to bring the cost of an efficient quartz mill within the reach of miners of limited capital.

The capacity of the mill is equivalent to a crushing force of about forty-five tons falling each minute, from a hight of ten inches. A caveat for this invention has been filed, through the Patent Agency of this office.

The Lead Manufactory.—Work upon Selby & Co.'s lead factory, at the corner of Folsom and First streets, is still progressing. The foundation of the shot-tower is well under way. The tower will be a frame, upon a brick foundation, and will run up to a hight of one hundred and eighty feet—twenty-eight feet in diameter at the bottom, and ten feet eight inches at the top—to be surmounted with a capola. The main structure is to be of wood, in order to avoid the danger which may reasonably be apprehended from the earthquakes which so frequently occur in this locality. It is expected that the works will be ready to commence operations by the first of June next.

Gassing.—Our Eastern cotemporaries have reached a point in the art of gassing on mining and petroleum operations, which quite takes the wind out of the sharpest of our Montgomery street operators. For instance: in one of the hundred stock companies started recently, the prospectus reads thus: "Petroleum rises all over it wherever a hole is dug, and coal gas abounds wherever a match is struck!"

The Red Bluff *Independent* states, on the authority of several gentlemen of much river experience, that the average current of the Sacramento river at low water is about four miles an hour; common high water, the average is about six miles. During the flood of 1862 it was as strong as ten miles.

NEVADA AND ENGLISH COALS—THEIR CONSTITUENTS.

The Newcastle coal mine, in Nevada, still continues to turn out considerable quantities of coal, which appears to be quite generally coming into use in that vicinity. The *Enterprise* gives the following analysis of this coal:

Moisture	19 65	
Hydro-carbonaceous matter	40 39	
Fixed carbon	28 37	39.76 charcoal.
Sulphur	traces	
Iron	traces	
Ash	11.45	
	100	

Specific gravity.....1.30

The coal very much resembles the brown coal of Germany, and might be regarded as a first-class fuel, both for gas and furnace purposes, were it not for the large proportion of water it contains. It will not produce coke, but yields, on distillation, nearly forty per cent. of charcoal, which ought to command a good price. Its volatile matter is in larger proportion than in English Newcastle coal, and by the addition of some carbonaceous matter, such as rosin, animal fat, etc., would produce about 9,000 cubic feet of gas to the ton, of equal brilliancy and greater purity than the English gas, owing to the very small quantity of sulphur it contains. In its present condition, as a large proportion of its combustible constituents are lost in evaporating the moisture, the assayer recommends that the company should adopt some means of getting rid of this constituent—either by partial charring in covered heaps, or drying in a current of hot air, whereby its commercial value might be increased from twenty to thirty per cent.

Remarks.—It will be interesting, in connection with the above, to notice the following analysis of several of the English coals, which are given on the authority of Dr. Letheby, in a lecture delivered by him before the British Association of Gas Managers, at a session recently in Manchester. The figures are the average results of several trials:

	Sulphur.	Ash.	Coke.	Volatile Matters.
Staffordshire	1.71	2.01	61.61	38.39
Lancashire	1.53	4.71	58.67	41.33
Newcastle	1.79	4.52	61.24	38.76
Scotch	1.22	5.46	57.32	42.68
Yorkshire	1.19	2.96	64.37	35.63
Welsh	1 09	3.66	64.37	35.63
			Charcoal.	
Nevada	Traces	11.45	28.31	60.44

We have placed at the foot of the list the analysis of the Nevada coal, arranged according to the table given in Dr. Letheby's report, in order that the comparison between the English and Nevada coal may be more readily observed. It will be noticed by the remarks of the *Enterprise* that the resultant from distillation of the Nevada coal is a *charcoal*, and not a *coke*, as in the English. The large excess of volatile matter in the Nevada coal consists chiefly of water, very little of which is present in the English coals. An analysis of the various coals obtained along the Pacific coast and brought to this market would form a very interesting item, and afford important economic data. Such a work of public benefit would prove a valuable card to any of our assayers or chemists who would undertake the same.

More Big Work.—The miners of Virginia City are becoming famous for "big work." A week or two since we chronicled some big work done in generous rivalry, between the day and night shifts employed in the Chollar mine. The Potosi has now been trying its hand in that direction. According to a Virginia paper that company shipped 420 tons of ore from the mine on Monday, the 23d ultimo. This is claimed to be the biggest work ever done at any mine in Washoe—yes, and probably the biggest ever done at any other single mining hoisting gear in the world, except for coal.

Narrow Escape.—A few days since, according to the Gold Hill *News*, a Mr. Henry Smith, a workman in the Gold Hill mill, while at work around the pans, was caught by his shirt sleeve on a revolving shaft, and would doubtless have been crushed to death had he not instantly braced himself against two horizontal beams; but the clothes were torn from his body, leaving him in Georgia costume. His presence of mind, and the convenience of the bracing beams, saved his life, although he received some severe bruises on the arm and hip.

Office Removed.—R. Wegener, Accountant and Mining Secretary, has recently removed his office to No. 415 Montgomery street, west side, between Sacramento and California Sts.

Spare the Hills.—It is said that there is a project on foot to grade Telegraph Hill in this city, whereby the value of property thereupon will be increased five hundred per cent.; and that thus that venerable and memorable land mark will soon fall before the hand of utilitarianism.

If this project looks to the cutting down of the hill, in accordance with the checkerboard plan of grade heretofore adopted in San Francisco, we opine the 500 per cent. increase, will be "over the left." If but a rational plan should be adopted, of reaching the summit by a *circular* grade, property will undoubtedly be greatly improved, and the city beautified and still protected from the ocean winds, by its sheltering hight. One of the most beautiful ocean drives which the world can produce might now be made by an easy grade from Sansome street, around Telegraph Hill, to the North Beach and beyond. An avenue thus laid out would afford a large number of the most eligible building lots in San Francisco. By all means spare the hills, and let not the "venerable and memorable" fall before the misconceived improvement to rob our city of its adornments and fill the purses of log-rolling street contractors.

New Map of Virginia City and Vicinity.—We have received a copy of a new map of the mines of Virginia City, Gold Hill, Devil's Gate, and American Flat Mining Districts, in Nevada. This is one of the most comprehensive and useful local mining maps which has yet appeared. It gives the geographical and relative position of upwards of forty quartz mills, and nearly 200 of the principal mining shafts, embraced in the above mentioned districts. It has been prepared from actual survey, by Messrs. Higginson & Goldworthy, Civil and Mining Engineers of Silver City, Nevada, and is published by A. Seasoul, bookseller on Montgomery street, in this city. This map having been got up by disinterested parties, and made from actual survey, by gentlemen eminently qualified for the work, possesses more reliability than any other of the kind which has been prepared and published by a company for some especial purpose. We can cordially recommend this map as one of especial value to parties interested in mining matters in Washoe, or those desirous of familiarizing themselves with the relative location of the numerous mines in the important region represented.

Petroleum.—One hundred and sixty thousand acres, of what is considered oil bearing land, have been secured by the Pioneer Oil Company, of Los Angelos. It is claimed that a large portion of this land may be divided up into square roods, and a well sunk upon the centre of each rood. Rather a greasy story to swallow. It is furthermore stated in late papers for that region that large and abundant springs of oil have been discovered upon the ranch of ex-Governor Downey, and that the indications are flattering that an abundance of oil can be obtained by sinking wells upon any part of his extensive estate.

Another Woolen Factory.—The people of Folsom are taking active measures toward the erection of a woolen factory in that place. The move is a good one. There is no good reason why Folsom may not be made the Lowell of California. Situated immediately upon the great line of steam communication throughout the interior of California, it also possesses a water power not at all inferior to any town on the Atlantic coast. Manufactories are the great need of California.

Ten million dollars worth of petroleum has been lost by exporting, or carelessly wasted, this year. Most of this loss has been from leakage and evaporation, nearly all of which may hereafter be saved by the use of the newly invented hermetical barrel.

A New Soap.—The Red Bluff *Independent* says that James Macklay, of Red Bluff is manufacturing a kind of soap which takes out grease spots and washes clothes without a washboard.

DESULPHURIZING COAL.

A citizen of Massachusetts has made a discovery, for which a patent has been obtained, by which the sulphur is extracted from Pictou and other cheap coals, so that they can be used for forges and iron work. The chemical is very cheap, costing less than one dollar per ton to prepare the coal. The coal thus prepared gives a stronger heat, and is better for iron uses, than the costly English coal now used. A New York paper says that the Novelty Works of that city have introduced it, and prepare the coal on their own premises.

We may remark upon the above, as we have heretofore done with reference to a similar experiment attempted, about a year since, in Stockton, in this State, that the value of the results aimed at have long since ceased to be a matter of doubt. We shall be pleased to hear again from our Stockton experimentors, as to whether they have yet obtained any practical results. The last heard from them was in May last, when it was stated that the experimentors were completely successful, on a small scale, and that they could easily be conducted on a scale of any desired magnitude. These experiments were made upon coal from Corral Hollow—the same upon which later experiments are said to have been satisfactorily made for extracting coal oil.

The desulphurization of coal is a desideratum which has been long sought for in Europe, but we believe it has never yet been accomplished there at a cost sufficiently low to make it available for practical purposes. From the above statements, however, which we clip from a New York paper, it would appear that the cost by the process there alluded to is very small, and quite within practical limits. If coal can be desulphurized as cheap as indicated, we see no reason why we may not expect quite a revolution in the use of coal.

Shankland's Improved Locomotive is again on exhibition at Nevada, and appears to be attracting considerable attention. We judge from the notices of it, that the improvement is in the "driving wheels," which are designed for ascending steep grades. The *Gazette* says that those who have seen its workings pronounce it a wonderful invention, which, if it accomplishes, in practice, what there is every reason to believe it must, will ennoble the name of the inventor with those of Fulton, Morse and Ericsson.

A Genuine Transaction.—The statement that an oil claim near Firebaugh Ferry had been sold in New York for $112,000 (currency) having been doubted in certain quarters, the editor of the Stockton *Record* sets the matter at rest by stating that he has seen a dispatch from Samuel Purdy, (ex-Lieutenant Governor of this State,) dated at New York, in which he not only confirms the report of the sale, but also gives the names of the parties in whose behalf the incorporation was made.

Silver in Placer County.—The Folsom *Telegraph* has seen some good looking silver ore from the neighborhood of Rock Springs, Placer County, which is supposed to be very rich, the discoverers show lumps of silver, which they say, has been melted from the rock, but refuse to impart any further information concerning the ledge at present.

The Stereoscope.—Many are of the opinion that the stereoscope is of modern invention. Sir David Brewster ascertained in the course of his investigations that its fundamental principle was known to Euclid; that Galen, who lived about the year 350, A. D., described it distinctly; and that Juan Baptista Porta had, in 1309, made such a complete drawing of the two separate pictures given by each eye, and of the combined pictures, placed between them, that not only the principle, but the actual construction of the stereoscope is recognized in it.

The largest refracting telescope in America has just been completed in Cambridge, and purchased for the Chicago University for $18,187. Its weight is five thousand pounds, and the length of the great tube twenty-two feet.

Horace Greeley does not succeed in farming. In a recent speech he said: "Twenty-five acres of my farm, or rather of my wife's, is forest-fenced, so as to exclude all the grazing animals, and the only part of it which does not cost me more than the return."

PETROLEUM—SUGGESTIONS TO PROSPECTORS.

The most important question which presents itself to the scientific prospector after oil is that with regard to its origin—Is it produced from coal, or has it resulted directly from the rocks where it is found?

If from the former, we need look for it only in immediate connection therewith, and below it, and we must attribute its production to a parting of the coal with its bituminous matters, which, being fluid, have found their way down through the seams and mass of the underlying strata, filling up the interstices and cavernous openings in large quantities, which feed the oil wells that are now being bored—the oil from which rises to the surface sometimes on the well-known principle of the artesian well, and at others by pressure from confined gases, which either exist in connection with the oil, or which are originated by the removal of pressure therefrom by the sinking of the wells.

If from the latter, a wider field of research is opened up to the prospectors, and there is less probability of an early limit being found to its yield. There is no absurdity in attributing its production directly to rocks having no connection with coal, as we shall be able to show in some future article, devoted more particularly to the origin of this remarkable substance. For our present purpose we will suppose, what in all probability is the truth in the case, that we are indebted for its existence both to coal and bituminous rocks, for either may produce it.

The most that has been established, up to the present time, is the fact that oil is found chiefly in connection with sandstone rocks, and always beneath the coal measures. This latter condition would be required under either hypothesis. The relative position of these rocks has already been given in a previous number.

At present, enterprise alone can deal with the development of this new source of material wealth, as science must wait upon the steps of labor, to discover the particular conditions of its formation and secretion. We must "accept the situation," and wait while our hardy miners successfully trace out its hidden resources by patient experience. In the meantime we will endeavor to throw out a few hints that may be advantageous to prospectors in this direction.

The paying wells of petroleum, at the East, are shafts bored into cavities in the rocks in which the oil has been collecting, from some source or other, for immense periods of time. Prospectors in searching for locations in which to bore their wells are usually guided by surface indications of oil. In some instances springs, as they are called, are found, where the oil comes to the surface more or less intermixed with water; less often the only indication is a mere saturation of the surface ground or rock with oil. Where the surface is found under either of these conditions, it is absolute proof of the existence of oil in the rocks, but no proof that *flowing* wells will be found. The latter condition can be expected only where a great basin exists below, into which the oil has gradually found its way during a long period of time, as already intimated.

But all wells are not flowing. The surface indications alluded to are quite sufficient to justify the sinking of a prospecting well, into which, if no "reservoir" is found to cause it to "flow," the oil in connection with water, may nevertheless find its way from the seams in the rock, much easier, and with greater facility than it can find its way to the surface. The deeper the well, as a general thing, the more favorable will be the condition for such accumulation. The water and oil from such wells is pumped into large tanks at the surface; where the oil by its lighter specific gravity floats upon the water, while the latter is gradually drawn off from near the bottom of the tank. Oil wells vary in depth from 100 to 1,000 feet.

When an oil spring, or any less striking surface indication is found, it is an important point to decide upon the locality for sinking the well. It is not always, indeed it is seldom, judicious to sink in immediate contact with the surface indication, especially if it be limited in extent. The underlying strata should be thoroughly examined; its dip and direction carefully observed; for the oil has probably come up by way of the seams between the different strata. You should consequently endeavor to learn in what direction it has come up, and then sink your well so as to intercept this upward stream, at a considerable depth—the deeper the better, in most cases. You will sink your well in this respect precisely on the same principle that you sink to strike a quartz vein.

As yet no wells have been sunk to any considerable depth in this State, and we are consequently quite ignorant of the geological location of the oil beneath the surface; whether it exists in isolated reservoirs, in extensive seams between the layers of the different strata, or whether we are to drain it off gradually from the rocks which are merely saturated with it, is yet to be ascertained. A number of wells are now in progress, from which we may in all probability soon be able to derive some valuable data. We shall lay before our readers such information as soon as it can be obtained.

There is a practice followed by some of the Eastern coal seekers, especially in Canada, which may be of some service here also. The miner as he goes down with his shaft prospects his gravel at frequent intervals by "panning out." The oil seeker may also employ nearly as simple a plan. Whether in prospecting on the surface or while going down with his well, let him occasionally take a small quantity of rock and break it up into very small particles and place it in a common retort, into the mouth of which the stem of an ordinary clay tobacco pipe has been carefully secured with well worked and fine clay. Place the retort in the fire, and when thoroughly heated, if there is any considerable quantity of bituminous matter in the same, it will be thrown of in the form of a burning gas, which may be lighted as it escapes in a small jet from the pipe-stem. Whenever such gas can be obtained from the rock, the Eastern oil borers will persevere with their work. This test may prove more or less, according to the manner in which it is manipulated. We shall have more to say of it hereafter.

A Good Idea.—An effort will be made at the approaching session of the New York Legislature to make it a penal offence to deface trees, rocks and bridges with advertisements of patent medicines and other wares equally worthless. Such an act ought to be passed by every Legislature in the land. The finest scenery up the Hudson, the most picturesque spots at the White Mountains, and the trees and bridges on the favorite walks and drives around our large cities, are all defaced by those horrible advertisements. The proprietors of these worthless nostrums, who hire men to go around and desecrate Nature in her sweetest and choicest nooks, ought to pay well for it. Nature belongs to God and God's children, and not to patent medicine venders. —*Springfield Republican.*

The above remarks are quite as applicable to the vicinity of San Francisco, as to that of New York.

Reese River Bullion.—We noticed yesterday, says the Reese River *Reveille* of the 3d inst., at Paxton, Thornburgh & Co.'s, a fine display of bars from the Social (Egan Cañon), Oregon, California Butte, Morgan & Muncey and Eureka Mills—sixteen bars, of the value of $12,207. The bullion was in part from the following mines: Social G. & S. M. Co., $3,615; Hubbard Mining Co., (Austin), $3,219; Oregon Mill Co., (Austin), $2,100, and other mines in lesser sums.

The Postmaster General, in his annual report, indicates that nearly a million of dollars is paid to foreign steamship owners for carrying the mails. Three and a half million dead letters reach Washington annually, and twenty-six hundred photograph and daguerreotype likenesses were missent in the same period. Over a hundred thousand letters are illegibly directed per annum.

"A model quartz mill" in full operation, and a full orchestra, are among the attractions advertised by the proprietor of a lager beer saloon in San Francisco.

MINING AROUND VIRGINIA CITY.

Much activity exists, at present, among the leading mining companies in the vicinity of Virginia and Gold Hill. There is more bullion being taken out at the present time than at any previous period. It is estimated that the shipments of the present month will reach fully two millions of dollars. The mills are all busy, and it is stated that the mill power of that section will be increased during the coming summer at least one-half.

The Imperial, Empire, Eclipse, Yellow Jacket, Consolidated, Challenge, Confidence, Crown Point, Belcher, Bacon—though small claims—are all producing largely in Gold Hill. Virginia City has the Chollar, Savage, Gould & Curry, and the Ophir. There are also many outside claims of lesser note, which are taking out large quantities of bullion.

The undeveloped ground on the Comstock ledge is fully five times the length of that which is developed; but it is expected that during the coming summer a large portion of this undeveloped property will so far be opened as to add materially to the bullion yield of this famous lode.

Recent reports from the Pine Woods district are highly encouraging. There is a report that a lead has been discovered, fully as large and promising as the Comstock. The Pine Woods district contains the celebrated lead from which it is supposed the Shoshone Indians for a long time have been getting rich specimens. It has been sought after for five years. The story is that an Indian was bribed with horses, blankets and grub, to show it to a party of enterprising explorers. If a tithe of that which is rumored concerning this new district be true, a tide of population will pour into it the coming summer, such as will form a marked feature in the mining history of Nevada.

Geographical Discovery.—A most important discovery, far more so than that of the alleged source of the Nile, has just been made in South America. It is that the great River Amazon has been found to be navigable from one end to the other; that in fact, a new route has been opened between the Atlantic and Pacific. The Morona, a Peruvian steamer, which was sent to explore the Amazon, has arrived at Mayro, about three hundred miles from Lima. The Morona navigated more than two thousand miles of the Amazon proper, and six hundred of the Yeayali and Pachitea Rivers, which, until then, had seen only Indian canoes. The country is, of course, inhabited only by savages, but it is of wonderful fertility.

Never Sulk.—Better draw the cork of your indignation, and let it foam and fume, than wire it down to turn sour and acrid within. Sulks affect the liver, and are still worse for the heart and soul. Wrath, when driven, in is as dangerous to the moral health as suppressed small-pox is to the animal system. Dissipate it by reflecting upon the mildness, humility and serenity of better men than yourself, suffering under greater wrongs than you have ever been called upon to bear.

Naturalists have remarked that the squirrel's continually chutting to his fellow squirrels in the woods, arises from the animal's love of gossip, as he is notoriously one of the greatest tail-bearers among the tribe.

The New York *Herald* estimated that there is $150,000,000 hoarded up by the people of the North, besides what is known to be in the coffers of the various banks.

What is knowledge? A key that unravels all mysteries, and which unlocks the entrance, and discovers new, unseen and untrodden paths in the hitherto unexplored fields of science and literature.

Furs.—A hunter passed through Marysville the other day with a large quantity of silver-gray fox skins, a very valuable fur, which he obtained on the South Yuba.

The Right Kind of a Claim.—There is a mining claim in Yuba County, with a capital stock of $20,000, which recently declared a dividend of $40,000!

Pittsburg, Pennsylvania, has forty-six foundries, consuming forty-six thousand tons of metal annually, and paying a million of dollars in wages.

A coal-oil millionare has named his little heiress Petrolia Ann. It is expected that the next little heiress will be named Carrie Sene.

Opinions from Practical Tests of Tyler's Improved Water Wheel.

Windsor, Vt., March 4th, 1859.

Mr. John Tyler:—It is now nearly two years since you completed the repairs of our Grist Mill, and we now take pleasure in giving you an expression of the merits and efficiency of your Wheel. We had formerly used an overshot wheel under sixteen feet head and fall, driving three run of stone. We are now using three 24-inch and two 30 inch wheels of your make, driving four run of stone and necessary machinery. Our stream is such that economy of water is of great importance. When we have the least water, we are satisfied we can do more business with your Wheel than we could with the overshot. In our Provender Mill (30-inch Wheel, discharging 80 inches of water) we have ground twenty-five bushels of corn per hour, good fine meal, and grind in the same proportion with our other Mills. Our Wheat Mills use 20 inches of water to grind as fast as we can bolt. Formerly we were troubled with back water—could not run the Mill from three to six weeks. Since using your Wheels, have had no trouble of the kind. They are sometimes submerged from three to nine feet. We have ground a bushel of corn in seven minutes with the Wheel in nine feet of back water, having only seven feet head, from the Connecticut River's backing up this stream. We have had no trouble from freezing, and not the slightest expense since they were put in operation. Our expectations have been more than realized, and would recommend all persons in want of a motive power, to examine your Wheels, before purchasing elsewhere.

Worcester & Woodruff.

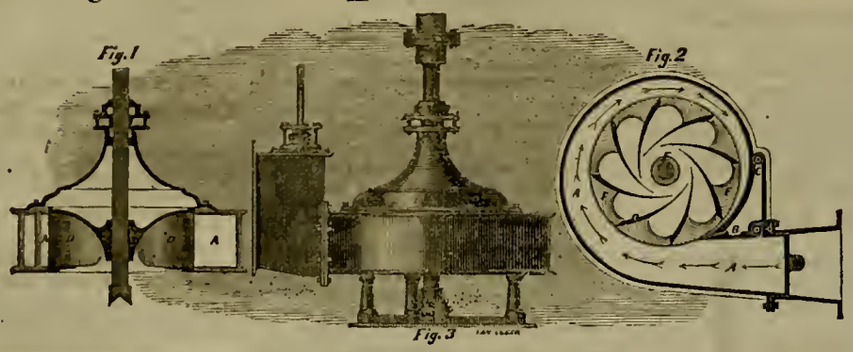
S. A. G. Mower, Miller.

Fitchburg, Mass., Jan. 20th, 1858.

John Tyler, Esq., West Lebanon:—Your favor of August 31st came duly to hand, and in answer to your inquiry as to your 36-inch wheel, will say, the Tyler Wheel was put in for the purpose of cracking and grinding plaster. Have cracked and ground from 3,000 to 3,400 lbs. per hour of fine plaster, weighing from 75 to 80 lbs. per bushel, with a head and fall of 7½ feet. There is five other wheels in our mill, and when all are running—this being in the lowest part of the mill—gives this wheel from 20 to 24 inches of back water. I should have answered your letter sooner, but our company had put in another wheel, called the Gatiss wheel (which I presume you are acquainted with), and I wished to test the two wheels for grinding corn, which I now use your wheel for, and I find I can do more business with your wheel, with the same water, than I can with the other wheel. Your wheel has been running about two years, and we have not laid out a cent on it for repairs, and it is always in order, and I can cheerfully recommend your wheel in preference to any other that I am acquainted with. D. H. Gilmore, Ag't.

East Corinth, Vt., Jan. 10th, 1859.

John Tyler, Esq.:—In reply to yours of the 7th inst. asking our opinion of your 3-foot Wheel which we have in operation, I can freely say that it proves to be just the thing I wanted, and all you recommended. I had taken some pains to inform myself in regard to the merits of the different kinds of cast iron water wheels within my knowledge, and finally decided upon buying one of your Wheels, and am fully satisfied that I have the *best* Wheel now in use. We are using it under 7½ feet head, and in place of a 6 foot tub wheel, and can do three times the amount of business with it that we could with the old wheel, and that, too, with much less water. It gives us a steady motion, is not obstructed by back water, nor liable to freeze up. I would advise all in want of a *good Water Wheel* to examine the *Tyler Wheel* before purchasing any other.



L. F. Hale,
Carriage Manufacturer.

Coatesville, Chester County, Penn.

Having lately put in one of John Tyler's Patent Water Wheels, and after using it eight months without giving me any trouble, I pronounce it the best water wheel of the age. I use one eighteen inches in diameter, under twenty-one feet head, to drive my grist and saw mill. This wheel gives over eleven horse power, making three hundred revolutions per minute. I strap from the wheel direct to the millstone, and thereby save all expense of gearing. My wheel cost seventy-five dollars, gives me more power, and I can do more sawing and grinding than I could with the eighteen feet overshot wheel I took out. The advantages of this Tyler wheel over all others now in use are so great that I would not have an overshot wheel if it was put in for nothing. Any person doubting this statement, will please call at my mill, situated one mile above Coatesville, and be convinced of the fact. For particulars address

B. I. V. Miller.

John Tyler's Improved Water Wheel.

Power and Working Velocity, and Water required for these Wheels.

TABLE, showing the number of inches of water (miners' measurement) required to give one horse power, under heads from 3 feet to 100 feet, and the horse power of wheels of all sizes.

TABLE, showing the number of inches of water required for different sizes of wheels from 9 inches to 48 inches in diameter.

TABLE, showing the number of revolutions per minute of different sized wheels from 9 in. to 48 in. in diameter.

EXPLANATION.—Find the head of water in the left hand column, and in a line with it, under the appropriate head, will be found the number of inches of water (miners' measurement) required for each horse power; the number required for each sized wheel; the horse power of each sized wheel; and also the number of revolutions per minute of each sized wheel.

This Invention received the Highest Prize Medal awarded to Water Wheels at the World's Exhibition, at the Crystal Palace, New York.

Wheels have been sold and are now running in most of the States and Territories in the Union, and in the Canadas. So thoroughly have they been tested that the subscribers have no hesitation in warranting them to give good satisfaction.

The following are some of the advantages claimed for Tyler's wheel over all others in use:

1st. Giving the best percentage of the water used.
2d. Its cheapness and durability.
3d. It runs equally as well *in* back water as *out*.
4th. It is not liable to freeze up.
5th. It is not obstructed by anchor-ice or other substances.
6th. It is adapted to high heads as well as low.
7th. It is not liable to get out of repair.
8th. It gives as good percentage with half gate as a full one.
9th. The friction on the step is materially lessened.
10th. The actual discharge of water is one-third less than the theoretical.
11th. It can be put to running by any machinist in a very short space of time.
12th. It is the steadiest running and easiest regulated wheel in use.

Parties in want of and interested in obtaining a valuable motive power, are requested to inform themselves further by referring to the parties using them, and those wishing circulars will please address the undersigned. All wheels are warranted to give satisfaction, and deeds for the right of use given only by the patentee or his authorized agents.

There are now some Fifteen Hundred of the wheels in operation in the United States and Canadas, driving all kinds of machinery, Cotton and Woolen Factories, Grist Mills, Saw and Paper Mills, &c., &c., under all heads from four to eighty feet, taking the place of Overshot, Brest and Turbine Wheels.

The attention of Commission Merchants is called to this wheel. It being portable, taking up but little room, it can be shipped to any part of the country with but little expense, and is an excellent wheel for the Pacific Territories, Nevada, Oregon, California, and Mexico, and all places where there are few mechanics, as it can be set running by any intelligent man.

☞ Orders solicited and promptly attended to, and circulars furnished, by

SMITH & HANSCOM, Agents for California.

Golden State Iron Works, San Francisco.

N. B.—Those ordering wheels, or making inquiries, should state particularly the head and fall, which way they want them to run, with or against the sun, the kind and amount of work to be done, also the town and county. ☞ Parties infringing on any of these patents—July 1855, 1856, 1858 & 1864—will be prosecuted.

MANCHESTER STATION, Conn., February 5th, 1859.

John Tyler Esq.:—I find your favor awaiting my return after a protracted absence, and hasten to reply. In regard to the "Tyler Wheel," I do not hesitate to say that I think it superior to any wheel I have ever seen tried in running a Paper Machine, its motion is so steady, and it acts with the same relative power with only a portion of the gate raised. I geared my work to suit the velocity given in your schedule of velocity, power, and quantity of water used with the gate fully open, but am pleased to find that I get all the speed and power I need with half gate. The Wheel is 24 inches in diameter, under 7 feet head. I have not used my Wheel over six months, and I believe I have saved its entire cost in evenness of paper over the paper made with the steam engine I was using. I expected a great deal from this Wheel, and am more than satisfied. It not only works well, but is simple, durable, and economical in the use of water. No paper machine should be driven with any other wheel, and I have no doubt of their doing good business for any work I have had in my mills, the "Parker," "McConnell," "Tub," and "Brest" wheels, and for the purpose I use it for, the "Tyler Wheel" is the best of the lot. On a stream near me, I am satisfied that one of your Wheels, put in last year, is doing more work *with the same water, and 9 feet less fall* than a Turbine of the same size of the Chicopee manufacture. M. HUDSON.

MALDEN BRIDGE, N. Y., Jan. 21st, 1859.

John Tyler, Esq., West Lebanon, N. H.:—Yours of the 7th inst. came duly to hand, and in reply can say that we have now had one of your two foot "direct acting" Water Wheels in use for nearly two years, under 14 feet head, and drive with it one 48-inch Paper Machine, with four steam drier cutters, and all the fixtures belonging with it; and do cheerfully recommend it to those having mill privileges to improve, and wish a cheap and good working power, as we consider it the best wheel of the kind in use with which we are acquainted.

PEASLEE & BENSON.

DOE RUN, Penn., January 15, 1859.

John Tyler, Esq.:—Your favor came duly to hand. In reply I would say that in July last I put in one of the Tyler Wheels at my saw mill, which has been running since that time, giving entire satisfaction. The wheel is twenty-four inches in diameter, running under a head of thirteen feet, driving the up and down saw, together with a twenty-two inch circular saw, at the same time, and with perfect ease. It drives the main saw at a speed of one hundred and seventy to one hundred and eighty strokes, and the circular at one thousand eight hundred to two thousand. It surpasses any wheel I have ever used for power, having taken the place of an overshot ten feet diameter and six feet wide, and using no more water, will do a vast amount more business in the same given time. So far as my experience goes, I can safely recommend the wheel, and would use it in preference to any other wheel I am acquainted with, being simple in construction, not liable to get out of order, giving a steady motion and not affected by back-water or ice.

GEORGE MITCHELL.

ST. JOHNSONVILLE, N. Y., July 6, 1861.

J. B. Fuller, Esq., Agent for Tyler's Water Wheel—Dear Sir:—For the benefit of mill owners, I would say that the three wheels you put in for me last year, are giving me entire satisfaction. The twenty-four inch wheel, with sixty-seven inches of water, twenty two feet head, carries my four feet circular saw for sawing lumber, exceeding, by far, any mill within my knowledge. The same wheel carries my grist mill, (across the street,) which can easily grind forty bushels per hour. I have a twenty-four inch wheel, thirty-five square inches water, same head, to carry my sash and blind works, upright saw mill, etc. I also have a twenty-four inch wheel at my lower mill, twenty-four feet head, which takes the place of a nearly new overshot wheel, carrying my heavy planing machine, saws, etc., *with less water than the overshot ever did.* Yours, truly,

A. THUMB.

N. B.—The above last named wheel was put in at my risk, after guaranteeing to do more work with the same water than the overshot wheel. J. B. F.

BROOKLAND MILLS, ROBINSON, C. E., May 24th, 1828.

John Tyler, Esq, West Lebanon, N. H.:—I have purposely delayed expressing an opinion as to the efficiency of your Wheels until I had an opportunity of testing their power under every contingency. It gives me much pleasure now to state my convictions that they are the best extant in every position. As to head or back-water, they have far exceeded my expectations.

JOHN T. CUMMINS, Agent.

To Refine Tallow for Candles.—Boil the tallow in water just made slippery to taste with ley. When cold, cut out and scrape from the bottom all impurities. Then boil the tallow slowly half a day in a kettle of water in which one pound of saltpetre (to ten pounds of tallow) is dissolved. When cold, and dregs scraped from it, boil again in water in which one pound of alum is melted. When cold, melt with one pound of bleached wax and and mould at your leisure.

A French physician is out with a long dissertation on the advantages of groaning and crying in general, and especially during surgical operations. He contends that groaning and crying are the two grand operations by which Nature allays anguish.

Some surgeons in London have succeeded, by scientific operations, in giving sight to persons born blind. There are touching descriptions of the surprise and confusion of those to whom the world is thus first opened.

Around the most splendid stars of life, dark halos are drawn, and the invisible God alone can evolve the serious and true from the eternal play of life and history.

The first submarine cable in America was made in 1843, by Horace H. Day, for Colonel Sam. Colt. It was insulated with India-rubber, and submerged in New York harbor, for the purpose of exploding a submarine battery used in blowing up the wreck of a sunken vessel.

Jupiter made a wound upon his head to let Minerva, the goddess of wisdom, find her way out, and ever since many mortals have thought it necessary to scratch their heads to enable a wise idea to escape.

A great man commonly disappoints those who visit him. They are on the lookout for his thunder and lightning, and he speaks about common things much like other people; nay, sometimes he may even be seen laughing!

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alteration, which they may desire made in their advertisements, at their earliest convenience. New advertisements should be sent in as early as possible.

For Advertising Assessments on Saturdays.

Levy your Assessments upon any day Except Friday.

Advertise the Assessment Notice on the First Four Saturdays succeeding the day upon which the assessment is levied.

Appoint the day for advertising the Delinquent Sale on the Fifth Saturday succeeding the date of levying the assessment.

Appoint the Day of Sale on the Seventh Saturday succeeding the date of levying the assessment, or any day *precious* to the Eighth Saturday.

Assessments ordered upon Saturday afford the Secretary the longest term in which to effect his advertising at the mine.

Extracts from the Statutes.

The attention of companies who desire advertising their delinquent sales in any other paper than that in which the notice of assessment appears, is called to the following section of the law approved April 4th, 1864:

Section 7. If any portion of the assessment mentioned in said notice shall remain unpaid on the day specified therein for the publication of the notice of sale, the Secretary shall, *unless otherwise ordered by the Board of Trustees*, cause to be published in the same papers in which the notice provided for in section five shall have been published, a notice substantially as follows, &c.

If, from a matter of convenience or necessity, the publication of an assessment is delayed, a very simple remedy is found in the following section of the law, relating thereto:

Section 14. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the nonperformance of any act required to be performed in order to enforce the payment of the same; but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall be void, and publication shall be begun anew

M. PRICE,

FOR HOME MADE CUTLERY.

No. 110 Montgomery Street, between Bush and Sutter.

San Francisco.

Razors, Knives, Shears, &c., made to Order and Warranted. Particular attention paid to Jobbing. Damaged Cutlery polished equal to new. Country orders promptly filled. 26-3m

THE ENTERPRISE.—The Virginia *Enterprise* has entered upon its sixth year and tenth volume. It appears in quarto form and greatly improved. It is the oldest paper in Nevada, and a most excellent journal.

MORE GOLD.—It is reported that rich deposits of gold have recently been discovered at the foot of the Cordilleras, in Buenos Ayres. This discovery is sufficiently distant to lend it the requisite charm to please the speculative.

THE oldest general in the world is not Gen. Scott, but Field-Marshal Combermere, of the British army. He is Scott's senior by seventeen years.

A suit was terminated last month in Hungary which had engaged the courts in that country for one hundred and eighty years.

THE water that has no taste is purest; the air that has no odor is freshest; and of all the most generally pleasing, is simplicity.

IT is a great mistake to think that the majority are always in the right. They were not so in the matter of the flood—and they have been wrong several times since.

The anger which flushes the face is not so deadly as that which makes it pale. The red heat is less intense than the white.

IMPORTANT DISCOVERY
— IN THE —
Photographic Art.

Jacob Shew's
CHROMATIC PROCESS OF PRINTING PHOTOGRAPHS.

[PATENT APPLIED FOR.]

THE UNDERSIGNED WOULD ANNOUNCE TO THE public that he has discovered a new and IMPROVED PROCESS for printing Photographs, which produces a

SOFTNESS, CLEARNESS AND DELICACY OF TONE

unattainable by any other known process and to which he has given the above name. It is applicable to any size of Photograph, and those having valuable old negatives which they desire printed by the improved process can do so at any time.

In order to secure the pecuniary advantages to be derived from this important discovery a patent has been applied for. When obtained, the privilege of the right will be disposed of at a reasonable rate to any Photographer desiring it. In the meantime all are warned against encroachments upon the rights of the discoverer as such will be prosecuted to the full extent of the law.

"Cartes de Visite" and large Photographs printed by this process will be furnished at the prices of the ordinary work of other establishments.

☞The public are invited to examine specimens at my Gallery. ☜

Machinery.

WM. BRUCKNER'S
Furnace for Roasting Ores,

Now in Operation at 416 Market street.

This Furnace, which is portable, and can be carried on muleback, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an iron Cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most

Economical and Practical Invention.

The furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three-fourths of a horse power for the smaller size. Parties wishing to erect such furnaces will please communicate to

W. BRUCKNER,
5v10 No. 416 Market Street, San Francisco.

IMPORTANT INVENTION.
Hunter's Concentrator, Amalgamator and Separator.

For the concentration of Gold, Silver and Copper ores, and separating all kinds of metals from the sands, when the specific gravity of the metal is greater than that of the rock, a machine is now on exhibition at No. 521 Market st., above First, at BACON & WEBSTERS'S Quartz Grinding Works, where it will be running from two to three o'clock P. M., for the inspection of all interested in mining. The inventor is prepared to manufacture machines to supply all orders promptly. The sixth of a horse power is sufficient to run one of these machines. For the above machine a patent has been applied for. Orders for machines, or for circulars and further information, should be addressed to

ANDREW HUNTER, Inventor.

The following extracts from Reports are submitted to the public as giving the results of a fair working test of these machines:

REAR VALLEY, DEC. 12, 1864.

MR. A. HUNTER—*Dear Sir:* I take pleasure in stating, in reply to your request, that your concentrator has now been running uninterruptedly, at Princeton Mill, for more than three weeks, and the enclosed notes, by the Superintendent Mr. Williams, of a carefully measured test of its performance during a period of a day and three-quarters, I believe fairly indicates what it has been doing through the whole of that time. First, the loss of the sulphurets, per cubic foot of tailings from the Concentrator, was about one-tenth of an ounce. Second, the loss of sulphurets from the blankets was nearly *fifteen times greater* than that from the Concentrator. The Concentrator has not been found at any time in the slightest manner out of order, and has required scarcely any attention. Congratulating you upon the these facts, I am, sir, very respectfully yours, FIELD, LAW ORNSTEAD, Manager Mariposa Company.

Notes of test run of Hunter's Concentrator—it having been supplied during the test with the sands reduced by one battery of the Princeton Mill, in the condition in which they are usually received by the blankets:—

Running time	1¾ days.
Amalgam saved on the plates of the Separator during above time, value	$6 75
Rate of saving of single machine per day	3 86
Rate of saving of six machines per day	23 16
Yield of Sulphurets, 1¾ days, pounds	215
Yield of Sulphurets, one days run of one Machine	123
Rate per day of saving from six machines, being the whole number required for the Princeton Mill	738
Yield of amalgam from plates of Separator, per ton of rock crushed, value	55
Yield of sulphurets from Separator per ton of rock crushed, pounds	18

HANNIBAL WILLIAMS,
Superintendent Princeton Mill.

SAN FRANCISCO, DEC. 18, 1864.

I have recently examined one of Hunter's Concentrators and Amalgamators, in operation at the Princeton Mill, Mariposa Estate, the sand and crushed rock, flowing from one battery of four stamps, passing directly over the machine, without using blankets. On examination, it shows conclusively that the loss of sulphurets by the machine is much less than by the blankets, being but a mere fraction of the sulphurets, consisting of the light and thin scales, such as can scarcely be saved by panning, while on the other hand the tailings from the blankets contain a large amount of heavy sulphurets. The product of the machine is almost pure, clean sulphurets—the copper plates of the machine, being amalgamated, securing much or all of the free gold that escapes the battery. I witnessed the cleaning up of the machine, and the collection of a ball of amalgam. From the weights taken we may state the constitution of this ore, as it came from the batteries at that time, as follows:

Clean Sulphurets containing free gold and amalgam	18.00
Quartz sand, waste	98178
Less of Sulphurets and tailings	.22
Total	200.00

WM. P. BLAKE,
Professor of Mineralogy, Geology and Mining, Mining and Agricultural College, California.

Disney's Cylinder Amalgamator.

The Cheapest and Best.

DISNEY'S CYLINDER AMALGAMATOR, WHICH HAS recently been introduced to the public, has already been proved a complete success, and can be furnished, at a price cheaper than any other in use. It is simple in construction, and so arranged as to do a large amount of work with the smallest expenditure of power. The proprietor is satisfied that he can do more work in a given time and with a given expenditure of power than any other amalgamator in use. For small companies who desire cheap yet effective machines, none can be more desirable.

It may be seen in operation at the Rail Road Foundry on Fremont street where

A NEW CRUSHER

Is in operation and he can crush and Amalgamate at the lowest rates. Miners and all others interested are invited to call and examine for themselves.

M. DISNEY, Patentee.

San Francisco, June 23, 1864. 1-3m

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the **PACIFIC FOUNDRY,**

1v10 San Francisco.

THE NOVELTY.

This ROTARY CYLINDER GRINDER & AMALGAMATOR *did not receive* the premium at the Industrial Exhibition. The one there displayed worked one hundred pounds at a charge, and was classed merely as a model, honorable mention of which being made by the committee. The inventor is now manufacturing some of the larger size of this machine, capable of working Two Thousand Pounds at a charge, and requiring no more power than is necessary for the pans now in use working but one-third that amount. This machine is simple in construction, durable and compact, very easy to clean up, and, in fact, is a perfect machine.

In offering his Amalgamator to the mining public the Inventor does not claim to have found the "Philosopher's Stone," nor any new method of extracting the precious metals from the ores, but does claim, as a practical mechanic and worker on milling machinery, that there was room for improvement in that direction, and that he has, by careful study, invented his improved ROTARY CYLINDER GRINDER AND AMALGAMATOR, known as the "NOVELTY," which mechanically overcomes the many difficulties that have heretofore arisen in the use of other machines.

This invention consists of a cylindrical-shaped case placed horizontally on legs, and provided with dies one and a half inches thick, making seventeen square feet of grinding surface, and having a rotary oblique muller (one or more) placed within it, and covered with shoes one and a half inches thick, and so constructed that all particles of rock must pass between the shoes and dies, causing it to be thoroughly reduced. The process of amalgamation is similar to that of the German Barrel, but much more rapid than that or any other amalgamator, as the muller gives three distinct motions to the pulp in one revolution. Heretofore, the chief objection to cylinder amalgamators has been the great wear and friction to which the journals were subject; but in this amalgamator that difficulty has been entirely overcome by the use of an adjustable metallic box, a new invention, that acts for the double purpose of a metallic packing and a journal box, and works to perfection.

This machine, when seen working will convince any practical man of its superiority over all others, and the public in general, and Miners and Millmen in particular, are invited to call and examine these machines, now in operation at the Miners' Foundry, where they are now being manufactured. Address, Miners' Foundry, San Francisco, Cal.

H. L. HOPKINS,

1v10 Inventor and Patentee.

DUNBAR'S PATENT SELF-ADJUSTING Piston-Packing.

Requires no Springs or Screws; Is always Steam Tight, without excessive friction, and never gets slack or leaky.

IT WILL SAVE EACH SEASON MANY TIMES ITS COST in friction, time, steam and power. No engine, old or new, should be without it. It can be easily fitted to old or new Pistons.

Having obtained the Agency of this VALUABLE IMPROVEMENT, I am prepared to furnish it wherever desired. For further information, address HENRY S. SMITH,

23v8 Golden State Iron Works, San Francisco.

HUNT'S NEW DITCHER.

HAVING SECURED FROM THE INVENTOR THE SOLE right to manufacture these Machines for the States of California and Oregon, and the Territory of Washington, I am now prepared to receive and promptly fill orders for these machines.

With the aid of three men and four horses this Machine will cut a ditch from two to three feet deep, as may be desired, dumping the earth all on one side so as to form a dike or embankment. For particulars send for circular, to

E. O. HUNT,

Windmill Builder, No. 28 Second Street and 110 & 112 Jessie Street, San Francisco. 9v22tf

SALMON'S PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

No.	Fine		No.	Fine
Assay	250	Assay	300	990
Assay	285	Assay for Czotman		980
Assay	286	Assay Water Rock		966
Assay	291	Assay Water Rock		938
Assay		St. Helena Lodge, W. D.		966

These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,

To whom all orders should be addressed. 15

Send in Your Subscriptions!

A New Volume of the PRESS commenced on the 7th of January, and now is the time to renew your subscriptions. If you believe in supporting our paper, send us in your own subscription, and as many of your neighbors' names as possible.

INVENTORS AND INVENTIONS.—Let us not cheapen inventions, but be kind to the inventors; beware of killing the goose that lays the golden egg! Many inventors die before the hour of triumph; others falter by the way. Invention is a struggle, a conflict, almost a battle; if the victors are rewarded, the dead are honored and the wounded carefully attended to. Glorify the inventors who succeed; cover with an indulgent self-respect the faults of those who fail; and soothe the last years of the wounded—those invalids of industrial science who have known only the pains of the fight, and always remained ignorant of the joys of victory —[Dumas.

1 Golden State Iron Works, San Francisco.

FARRAND'S Oscillating Amalgamator,

RECEIVED THE

ONLY PREMIUM

AWARDED FOR AMALGAMATORS

At the Recent Industrial Fair

OF THE

Mechanics' Institute of San Francisco.

Committee of Awards.

O. BELDEN, W. T. CARRATT, H. P. WAKELEE,
O. GOSS, GEO. JOHNSON, C. M. RADCLIFF.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

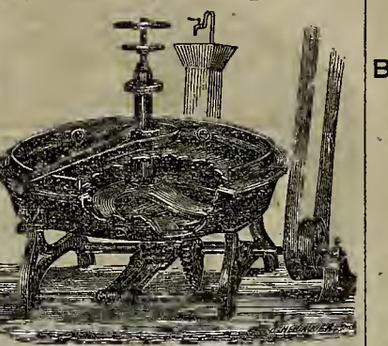
2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.



W. D. FARRAND, Inventor,

R. L. OGDEN, Agent, SAN FRANCISCO.

S. E. corner Montgomery and California streets.

19v9

BAUX & GUIOD'S Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is incouiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refuse, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address **J. B. BAUX,**

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

Hepburn & Peterson's AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; amongst which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. between 3d and 4th.

[Illustrated in the Mining and Scientific Press, April 9th, 864.] HEPBURN & PETERSON.

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crucodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. **B. FAUCHERY, Engineer,**

24v9

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15-1m

PRATER'S PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to HUNGERFORD & PRATER, Proprietors.

San Francisco, April 1st, 1864. 14v8-tf

Pacific BEATER PRESS Company.

SAN FRANCISCO, CALIFORNIA.

This Company are prepared to manufacture and sell the celebrated PORTABLE BEATER PRESS, so well known in the East, where it has, in the short space of two years, almost entirely superseded all other

HAY AND COTTON PRESSES.

This Press is easily moved from place to place, requiring only two span of horses over any ordinary road; is worked with great facility by steam or water power; and two men with a span of light horses in ten minutes time will turn out a bale of hay. In dimensions measuring three feet eleven inches in length, twenty-two inches width, and from twenty-four to twenty-eight inches in depth, and weighing from four hundred to five hundred pounds.

The fact that Beater Pressed hay commands a BETTER PRICE in market than any other, is substantiated by the market quotations of New York and other Atlantic as well as Western cities. Hay baled with this press is much cleaner than that baled by any other in use, being completely freed from all dust by the action of the beater, besides being so compactly pressed as to be fire and water proof.

This press is equally efficient for Cotton, Wool, Fulu, Tow, Hemp, Hair, Manilla, Oakum, Hops, Rags, Shavings, &c. No other Press can make so good a bale of cotton, and make it retain its compact shape. Parties interested are invited to call and see one in operation.

Office and Warehouse—MISSION STREET, between Main and Beale streets.

W. H. MITCHELL,

2v10 **General Agent.**

HUNT'S IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order, they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

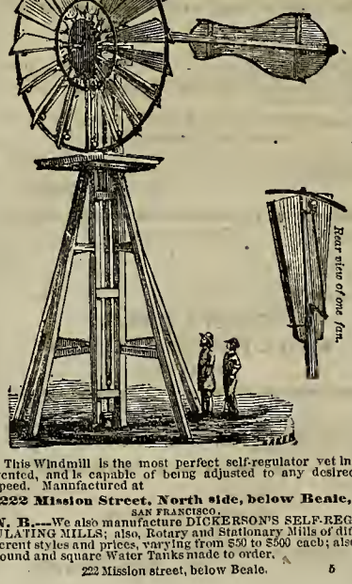
HUNT'S ENDLESS CHAIN

HORSE POWER For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.



ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

Office, No. 509 Clay street, City and County of San Francisco, California. ja28-4-4

La Paz Town Association, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 17th day of January, 1865, an assessment of fifty cents per share was levied upon the Capital Stock of said Company, payable on the 17th day of January, 1865, in United States gold and silver coin, to the Secretary, at the office of the company.

Any stock upon which said assessment shall remain unpaid on the Saturday the 18th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Tuesday, the 7th day of March, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

B. W. MUDGE, Secretary.

Office, No. 528 Clay street, San Francisco, Cal. ja21-3-4

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the Mining and Scientific Press. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

La Libertad Gold and Silver Mining Company,
Cacachillas District, Lower California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 28th day of January, 1865, an assessment of thirty-five cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 4th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 18th day of March, 1865, to pay the delinquent Assessment, together with costs af advertising and expenses of sale. By order of the Board of Trustees.

WILLIAM VALE, Secretary.

Office, No. 36 Exchange Building, N. W. corner of Montgomery and Washington streets, San Francisco.

feb4-5-4

Louisiana Silver Mining Company, Reese River Mining District, Lander County, Nevada.

And in accordance with law, and an order of the Board of Trustees, made on the 3d day of January, 1865, so many shares of each parcel of said stock as may be necessary will be sold at the salesroom of Edwards, Olney, & Co., No. 626 Montgomery Street, on the 13th day of February, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

B. B. FORESTER, Secretary.

Office, No. 311 Commercial street (two doors above Front) San Francisco. feb4-5

United States Mining Company, Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 20th day of January, 1865, an assessment of one dollar per share was levied upon the Capital Stock of said company, payable on the 21st day of January, 1865, in United States gold and silver coin, to the Secretary, or to JAS. V. COFFEY, at Virginia.

Any stock upon which said assessment shall remain unpaid on Saturday, the 25th day of February, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 11th day of March, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, Nos. 8 & 10 Government House, corner Washington and Sansome Streets, San Francisco, Cal. ja21-2-4

Illegal Advertising!

We notice many Secretaries are having their notices of delinquent sales published *weekly* in a *daily* paper. As this is a plain violation of the new law we feel it our duty to warn such parties of this error, and herewith append that section of the "Act Concerning Assessments upon the Stock of Corporations," which governs the publication of delinquent notices.

Section 9. Said notice, when published in a daily or weekly paper, or in both, shall be published as follows: When published in a daily paper, the same shall be published for a period of ten days, excluding Sundays and holidays, previous to the day of sale. When published in a weekly paper, the same shall be published for two weeks previous to the day of sale, the first publication in the weekly being at least fourteen days prior to the day of sale.

By the above extract it will be clearly seen that no delinquent stock can be legally sold by advertising in a daily paper, unless the notice is inserted *daily*.

A VALUABLE NEWSPAPER.—The "Mining and Scientific Press," published by Dewey & Co., in San Francisco, is a useful and instructive journal for the miner and mechanic; offering a vast fund of information respecting the working of metallic ores, the improvements in mining and other machinery, etc., etc. The PRESS deserves a liberal support from miners and artizans. Terms—$5 per annum, or $3 for six months.—*Placer Herald.*

Just and True Economy

IN MINING ADVERTISING.

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEE and SHAREHOLDERS, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by ONE HALF than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, unitrammeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it

TO MINE OWNERS.

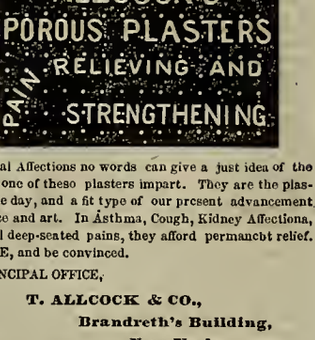
REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Address **J. MOSHEIMER,**



Office, Nos. 14 & 15 Mead's Building, Corner of Pine and Montgomery Streets, San Francisco. 9v23tfq

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat, pain, and jaundiced appearance, activity, strength and renowned health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

Our Circulation.—The MINING AND SCIENTIFIC PRESS has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

Mining and Scientific Press.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

DEWEY & CO., PUBLISHERS And Patent Solicitors. | SAN FRANCISCO, SATURDAY, FEBRUARY 18, 1865. | VOLUME X Number 7.

Contents:

Vol. X, No. 7—Fenruary 18, 1865—Metallurgy of Copper in California—No. 4; The Problem of Gold and Silver Extraction; Hansbrow's Patent Mining Pump—Illustrated; Petroleum at the East; A Furnace for Burning Coal Oil under Steam Boilers; More about Calvert's Process; From our Journeying Correspondent; Grass Valley Correspondence; Letter from Sacramento; How to Utilize Sage Brush; Prof. Blake—The Proposed Mining Bureau; El Paso Redivivus; Los Angeles Inventions; Shankland's Locomotive and Track; Minerals from Salt Lake; Intelligent Farming; Cave in the Gould & Curry; Another Underground Engine; Improvement in Horse Shoes; Prices Current; Mining around Virginia City; Editorial and Selected; Stock Sales and Reports; Mining Shareholders' Directory; New Mining and other Advertisements, etc.

☞ New Mining and Miscellaneous Advertisements on page 109 ☜

☞ Mining Directory on page 104. ☜

Particular Notice.—Whereas Julius Silversmith persists in announcing himself as "late editor of the Mining and Scientific Press," we wish it distinctly understood that he has had no connection whatever with this journal for the past two years, or since it assumed its present form; nor has either of the present proprietors ever been, in any manner, associated with said Silversmith.

"A Word to the Wise," Etc.—Parties in the Eastern States who desire positive information concerning the mineral wealth and developments of the Pacific States, should look for the same in some journal, published on this coast, sufficiently truthful to enjoy a permanent circulation in the communities represented. Those credulous enough to patronize the mushroom bantlings of defunct California Jeremy Diddlers may expect to get "bilked."

A QUERY ANWSERED.

Eds. Press:—Please answer the followiag question, and oblige several of your

Subscribers.

If a metal ring be made of any given diameter, would the area of the said ring be the same as the area of the ring would be, if bent into the form of a square?

No. The area enclosed by the square will be nearly one-quarter less than that embraced in the circle. If we represent the ring as 4, that of the square will be 3.14. In proof of this statement we subjoin the following

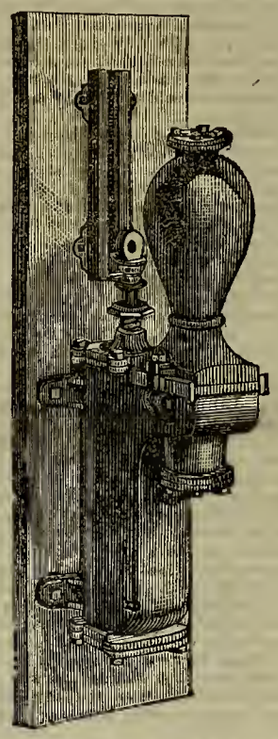
Demonstration:—The question, as understood by us, is this—What is the proportion of the area of a circle to the area of a square, both having the same perimeter?

Let the diameter of the circle=d

Let the proportion of the periphery to the diameter of the circle=p

Then we have for the area of the circle $\frac{pd^2}{4}$ while the periphery or perimeter of the circle =p.d

The side of a square, having the perimeter p.d equal to $\frac{p.d}{4}$, and its area $= (\frac{pd}{4})^2 = \frac{p^2d^2}{4^2}$.



The proportion of the area of the circle to that of the square, both having a perimeter pd, is now as $\frac{pd^2}{4} : \frac{p^2d^2}{4^2}$; or as $\frac{4pd^2}{4^2} : \frac{p^2d^2}{4^2} = 4p :$ $p^2 = 4 : p = 4 : 3.14 = 4 : 3\ 1\text{-}7$.

Croakers.—Despite the established facts known to the reading public, we yet have a class of doubters in our midst, and of late a belief seems to have gained credence among many, to the effect that we cannot produce kerosene oil, suitable for illuminating purposes, from the native petroleum fonad on this coast. The premises taken by a late writer in the columns of an evening cotemporary, that "if kerosene existed, at any depth below the surface of the asphaltuai springs, it would be found on the surface, because the lightest oil is always found on top," possesses the single merit of being novel, although not more so than other ideas which he advances. As that writer pretends to have had some experience in refiniug oil, he should have been awure that kerosene, naptha, or hydro-carbon oil, is never fonnd in nature in a state of purity, and disengaged from the heavy oils. The different grades of oil contained in mineral tar, or crude petroleum, can be separated from each other and accompanying substances by destructive distillation only; and can be purified only by chemical manipulation. We have received a communication on this subject from a gentleman thoroughly conversant therewith, which will appear next week.

Church-Going in San Francisco.—It is generally supposed at the East that the population of San Francisco is not much noted for its church-going proclivities. Upon consulting the directory of New York city and of San Francisco, we notice that the former city has a church for every three thousand inhabitants, while San Francisco has one for every twenty-three hundred and sixty—quite a margin in favor of our California Metropolis.

HANSBROW'S MINING PUMP.

Annexed we give a representation of Hansbrow's Patent Mining Pump, which is becoming very popular, owing to its acknowledged superiority over most pumps hitherto introduced. The construction of this pump is such that it is but little liable to get out of running order, and it can be taken apart and put together in a few moments, in case anything obstructs its movements.

In this pump the plunger works in the cyliader like the piston of a steam eagine, the valves being placed in the projection below the air chamber. It is made to force the water, while in a steam cylinder it is itself forced by the steam. The forcing pressure is continuous upon the water, whether the plunger is moving up or down. The water is delivered through the top of the air-chamber, from a pipe which is made to decend about two-thirds its depth, while it is received through a pipe entering the suction opening just below the valves. The plunger is regulated, in its motion, by a slide guide, as seen in the engraving.

The inclined valve seats (peculiar to all of Hansbrow's pumps) prevent the sand that may pass through the pump from remaining under the valves. This pump has a six inch cylinder, with eighteen inch stroke, and is capable of forcing a three inch stream two hundred feet high. Smaller sizes of this style afford a superior pump for deep wells and windmills.

The first premium was awarded to this pump at the late Mechanics' Fair, and the Hand Pumps of the Hansbrow Patent took the only medal given to pumps of this class at the London Exhibition in 1862, over more than three hundred competitors. These pumps are manufactured under the supervision of Mr. Hansbrow, and are warranted to give perfect satisfaction. His hand pumps are powerful, and especially adapted to mines not yet having steam power, and also for all domestic purposes. All sizes and styles of the pump can be had of Locke & Montague, 112 & 114 Battery street, in this city.

A Boot Blacking Machine.—Boot-blacking by machinery is among the latest "Yankee inventions." A machine to accomplish this work has been invented by Mr. A. E. White, of Rockford, Ill., and one of them has found its way to this city. We have seen it in operation at the St Lawrence House, on Market street. The object of the inventor has been to devise a machine by which boots and shoes may be blacked and polished more expeditiously than can be done by hand, and in this purpose he has succeeded admirably. The machine consists of a square piece of frame work, supporting two rotary brushes arrayed aronnd the axis of a shaft, and runaing at different rates of speed; the one brush is designed to put on the blackiug, and the other to polish the same. The entire machine stands thirty-three inches in hight, and is about twenty inches square. If a man wants to have his boots blacked, all that he has to do is to "put his foot in it." It is capable of doing its work much more rapidly than it can be done by hand, one minute being sufficient time for blacking a pair of boots. In order to prove the efficiency of this machine, it will be placed on Montgomery street some day next week, on which occasion the entire crowd on that popular thoroughfare will have an opportunity of being "black-balled" free of expense.

Rich Strike.—A private letter from our traveling correspondent in El Dorado county, dated the 14th inst., contains the following interesting item: "On Saturday last, near Georgetown, an old miner, with only twenty-five cents in his pocket, made a rich strike in quartz, from three pans of which he took $500. Mr. Orr, proprietor of the stage line between Folsom and Georgetown, is my informant. He assures me that he saw the first pan that was washed out, and that it was the richest one he ever saw, and that there was plenty more in sight. The range of country is the same as that which passes through Nevada and Grass Valley."

Our correspondent further informs us that the Rhodes Mill is now running twenty stamps, and crushing from twenty-five to thirty tons of rock each twenty-four hours, with an average yield of fifteen dollars per ton. They are now down one hundred and seventy feet. They amalgamate with the copper shaking-table, employing the second set which has been put up in the State. It is claimed that they work well. Mr. Charles Crandall is the Superintendent of this mill. The mines of that region seem to be looking up considerably.

Some very fine oranges were shown our correspondent, which were raised the past season near Salmon Falls, another evidence of the prolific resources of our State, even in this high latitude.

An attempt will be made to raise a cotton crop in Fresno county this year. Last year the plant was successfully cultivated in Los Angeles county.

Written for the Mining and Scientific Press.

Metallurgy of Copper in California.

[By Paul D'Ivernois, M. D., Mining Engineer, Professor of Chemistry and Metallurgy, Superintendent of the Copper Mining and Smelting Company, Queen of Bronze, Oregon.]

NUMBER FOUR.

COST OF REDUCTION.

In the last article we gave an approximate estimate of the cost of the erection of works for the reduction of copper ores. We will now submit to our readers an exhibit of what the reduction of the ores cost.

It would, perhaps, have been more logical to finish our essay with these calculations; but we think that the interested will be curious to know the amount of these expenses, and to compare them with the cost of exportation. While anticipating their wishes, we produce, at the same time, the strongest of our arguments in favor of reduction at the mine. We hope that this argument of figures and facts will succeed in bringing over to our opinion those who still hesitate, and that, after having computed the advantages of smelting our ores, those interested will read with more courage, the long and dry description of the working of copper. Our statement of the work and the quantity of things necessary to each of the operations of reduction, has been taken from the books showing the cost account in the establishment at Boston and in several German copper works. To these tried and immutable statements we have applied prices proportionate to the wages and cost of materials in California.

The following are the basis on which we have established our calculations, which every one can modify as may be necessary in case our estimates are not applicable to any locality: We estimate a cord of pine wood, cut in long and large pieces, at $1.35. We think it does not cost more in our mountains. It costs us one dollar at the Queen of Bronze. We estimate at three dollars a cord of wood cut in pieces suitable for calcination, either in piles or in kilns. A cord of dry pine weighs about 2,000 pounds, and makes 25 per cent. of charcoal, or 32 bushels, weighing 15½ pounds each, or 500 pounds of charcoal for each cord of wood. By means of good arrangements, and Chinese labor on a large scale, charcoal can be burned at two cents a bushel, delivered at the furnaces. The cost of charcoal, then, would be eight dollars a ton. We ascertain the cost of labor thus:

A Chinaman, per day	$1 25
An ordinary workman	2 50
An expert	5 00

Experts being the fewest, we make an average, which we place at three dollars, for a days' work. This being established, let us see the cost of reduction. We must remind our readers here that all our calculations are based on six tons of ore, yielding twenty per cent. of copper. We have called 2,000 pounds a ton in order to work on round numbers:

CALCINATION IN HEAP.

Wood, 480 lbs.	$0 72	
Labor, 90-100 of a day	2 70	
		$3 42

FUSION FOR REGULUS.

Charcoal, 2,400 lbs.	$9 60	
Brasque	36	
Workmen and superintendence, 4,836-1000 days.	14 51	
Tools, repairs, and other expenses	60	
		25 07

CALCINATON OF REGULUS.

Wood, 240 lbs.	36	
Workmen, 804-1000 of a day	2 41	
		2 77

SMELTING FOR BLACK COPPER.

Charcoal, 900 lbs.	3 60	
Brasque	36	
Labor and superintendence	6 97	
Tools and different expenses	60	
		11 53
Machine and re-smelting of the regulus of the preceding		6 00

PURIFYING OF BLACK COPPER

Charcoal, 1,700 lbs.	6 80	
Brasque	1 20	
Labor, 2⅝ days	8 00	
Utensils, repairs, and various expenses	2 00	
		18 00
Total for the reduction of six tons of ore yielding 2,400 lbs. of roscite copper		$66 79
Making for the cost of a ton of copper		$55 64

COST OF A TON OF COPPER DELIVERED AT SAN FRANCISCO.

The furnaces will make seventeen seasons, of fifteen days each, every year—that is to say, 255 days of smelting, and 2,400 pounds of copper produced every day, or 306 tons of copper a year, coming from 1,836 tons of ore.

We will suppose the distance of the mine from San Francisco makes the freight fifteen dollars a ton. We will allow five dollars a ton for the expense of extraction, and a capital of $30,000 employed in the establishment:

Extraction	$30 00
Reduction	55 64
Freight	15 00
General Expenses	40 00
Interest of $30,000 (one % cent.)	11 76
Storage, transportation, and small expenses	2 00
	$154 40

This ton of copper being supposed to be of an average value of $500 in gold, leaves to the producer a profit of $345. We will find a sale for this copper at San Francisco at the current prices, as if it were the the negociation of bars of silver or gold, merchants being able to make their remittances to the Eastern States or to Europe in bars of copper as well as in bars of precious metals.

COST OF SIX TONS OF ORE DELIVERED AT SAN FRANCISCO.

Let us see now the calculations for the sending of six tons of ore to San Francisco. The basis of our calculations are the same as above, except that we reduce the general expenses by half, since there is not a smelting establishment attached to the mine, and, for the same reason, we reduce the capital invested to $10,000:

Extraction	$30 00
Bags	24 00
Freight at $15 per ton	90 00
General expenses	20 00
Interest on $10,000	3 92
Storage carriage	12 00
Assay and different mine expenses	6 00
	$185 92

We see, even now, that this sum exceeds that of the cost of a ton of copper delivered at San Francisco; but we are not at the end of the account. We will have sent ores yielding twenty per cent. by the assay of the superintendent or that of the assayer of the mine, but the assay of the agents of the purchasers will reduce this ore to eighteen per cent., and there can be no objection made, for they understand one another. Afterwards, there will be a further diminution of one and a-half per cent. for the difference between the humid assay and the dry assay, which is practiced at Swansea, which leaves in the hands of the seller an ore reduced to sixteen and one-half per cent. of copper.

There is paid, in the market, in cash, in gold, $2.85 for each unit of copper in a ton of 2,376½ pounds—which makes $2.40 for a ton of $2,000 pounds, or for six tons, $237.60. The expense being $185.92, we see that the profit is $51.68; but we will soon understand that we must not delude ourselves in this sum of $51.68 profit.

By the accounts which we have just given above, we perceive that the ore containing 14½ per cent. should be abandoned at the mine. This ore of 14½ per cent. would be reduced to 11 per cent. by the buyer, and, at this rate, there is no profit in shipping it in the condition of our mines. Now the ore of 14½ per cent. is very abundant in every good mine. We have had to pay the same expenses of extraction for it as for the richer ore; therefore the richest ore alone has to bear all the expenses of extraction, which, for this reason, will reach to ten, fifteen, or twenty dollars a ton—a circumstance which exhausts very soon the $51.68 which we have received for the 12,000 pounds of number one ore sent to San Francisco.

Some will say, we must concentrate the ore number two by crushing and washing. The observation is simple, but the execution is complicated. We fear that the ore cannot support the expenses of concentration in California at present. We have consulted the figures, and they have said "No!" So much the better if experience gives the lie to figures.

We will not speak of another mode of shipping to England, with advances of 60 per cent. on the estimated value of the ore. This mode is still more disadvantageous than the sale of which we have just spoken.

To sum the matter up: on one side is an average profit of $335; on the other side is a trifle of profit, or, what is more probable, a loss!

We hope that the data upon which our figures are established will satisfy the most difficult; if they do not, we will accept, with pleasure, the discussion of the question in this or any other journal. We have but the truth in view, and it is by a true exposition of the condition of things that we wish to press a development of our copper mines, and to save them from the discredit into which they have been thrown by dishonest speculators and unskillful experimentors. This end we will pursue without intermission, for we have a profound conviction—and this conviction is based on a long experience—that this country will find in a wise working of these mines an immense and inexhaustible source of wealth.

An Important Mineral Discovery.—About fifteen miles above St. Joseph, near the Missouri river, an extensive body of very peculiar clay has been discovered. When first taken out it can be easily cut into any shape desired, and a surface made as smooth as glass. In a few hours it hardens, becomes firm as a rock, and has a whiteness equal to snow. In Texas and Utah this kind of clay is used for building purposes and is exceedingly beautiful.

We received a visit, yesterday, from J. M. Wolf, the gentlemanly agent of the Mining and Scientific Press, who is soliciting subscribers. The Press is an excellent paper and should be in the hands of every miner and mechanic.—*Folsom Telegraph.*

[Written for the Mining and Scientific Press.]

The Problem of Gold and Silver Extraction—A General Review.

BY PROF. L. LANZWEERT.

The lustre of gold is highly metallic and shining, and owing to the small amount of foreign substances or oxydation on its surface, it preserves its shining lustre even after long exposure in contact with other substances. Thus the shining particles are often seen in sand when the quantity is barely sufficient to repay the cost of working, notwithstanding the value of the metal. Even, however, if the surface is dull, the true color and appearance are easily restored by rubbing, and when polished, it takes a very vivid lustre, which is preserved for a long time in the atmosphere. Although in the division which has been introduced, into gold-yellow, brass-yellow, and grayish-yellow, native gold seems, with some slight modifications, to agree with the geological relations of its varieties; yet this method of arrangement deserves little serious notice. The gold-yellow varieties comprise the specimens of the highest gold-yellow colors, though there are some among them which have rather a pale color. They include most of the crystals and of the imitative shapes—in fact the greater part of the species itself. The brass-yellow native gold is confined to some of the regular and imitative shapes, of a pale color (which is generally called brass-yellow), and, as it is said, of a less specific gravity than the preceding one; but this does not seem to have ever been ascertained by direct experiment. The grayish-yellow native gold occurs only in those small flat grains which are mixed with the native platina, and possess a yellow color, a little inclining to grey. They are said to have the greatest specific gravity of them all. The real foundation of these distinctions seem to be the opinion that the first are the purest, the second alloyed with a little silver, and the third with platina. It is now well established, without controversy, that these alloys are found in some of the California gold.

In color and lustre, some inexperienced persons might mistake various substances for gold. These are chiefly iron and copper pyrites; but from them it may be readily distinguished, being softer than steel and very malleable, whereas iron pyrites are harder than steel, and copper pyrites are not malleable; for although the latter mineral yields easily to the point of a knife, it crumbles when we attempt to cut or hammer it, whereas gold may be separated in thin slices, or beaten out into thin plates by the hammer. There can thus be no possible difficulty in distinguishing these various minerals in a native state, even with nothing but an ordinary steel knife. From any other mineral as mica, whose appearance has also misled some persons—as the case happened in the early times of California gold-seekers, witnessed by the author, in the office of Adams & Co., at Coloma, when an Irishman was nearly thunder-struck as the clerk of the office blew all his supposed gold away. In this case, gold is easily known by very simple experiments with a pair of scales, or even by careful washing with water; for gold being much heavier than any other substance found with it (except platina and other metals), will always fall first to the bottom if shaken in water with mud, while mica will generally float, or be the last material to fall.

Gold, therefore, can be distinguished by its relative weight or specific gravity, and by its relative hardness, from other bodies which resemble it. It is described generally as soft, completely malleable, and flexible, but more accurately as softer than iron, copper or silver, but harder than tin and lead. It is useful to know facts of this kind, as a simple experiment that can be made with instruments at hand is often more valuable than a much more accurate examination requiring materials not immediately available. Thus, if it is found that a specimen (perhaps a small scale or spangle) is readily scratched by silver, copper, or iron, and scratches tin and lead, it may, if of the right color, and sinking rapidly in water, be fairly assumed to be gold.

Having now explained, at some length, the more manifest characteristics of gold—namely, its color, hardness, specific gravity, and alloys—it is necessary, before explaining the mode of separating it from associated minerals, that we should here give some account of the behavior of this metal under the blow-pipe and when exposed to simple chemical tests. The assay of gold and its accurate analysis we postpone for the present. The method of blow-pipe analysis, although exceedingly useful, is not absolutely necessary in the case of gold, because of the many readier ways of determining the metal. When gold is pure, it is unaltered by the continuance of the heat. In this respect it differs entirely from iron and copper pyrites, which, on being exposed to the flame, give off sulphur fumes and undergo considerable change. In the case of gold containing other metals, these, with the exception of silver, may generally be got rid of by continuing the heat in the interior flame with the addition of a little nitre. Before the oxy-hydrogen blow-pipe, the metal is volatized in the form of a purple oxyd.

When a piece of gold is broken (which is not done without difficulty—greater in proportion to its purity), the fractured edges are very uneven and torn, exhibiting a fibrous appearance, known to mineralogists as "fine hackly." This fracture indicates that the mineral is *torn asunder*, and not really broken, and is a proof of considerable toughness.

Gold is not acted on by any of the acids alone. When exposed to the mixture of nitric and hydro-chloric acid (in the proportion of one part of nitric to three or four of hydrochloric), called *aqua regia*, it dissolves without residue, the solution giving a purple precipitate with protochloride of tin, a brown precipitate with protosulphate of iron, and yellow metallic gold by oxalic acid. Electrum (the alloy of silver above alluded to) is only partially soluble in *aqua regia*, giving a residue of chloride of silver. The solution is acted on by protosulphate of iron, as already explained. The following simple method of detecting attempts at imposition in gold dust is worthy of being recorded in this place: Place a little gold dust in a glass tube or earthern-ware saucer, and pour nitric acid upon it; then hold the glass or saucer over a flame, or upon a few embers, until red flames (nitric vapors) arise. If it be pure gold, the liquid will not become discolored; but if pyrites or brass filings should have been mixed with it, the acid will become turbid, green and black, discharging bubbles of gas. After the ebullition has ceased, the residue should be worked with water, and acid again poured upon it, when the same effect may be observed, but in a less degree; and if the experiment be repeated until all effervescence ceases, it will finally leave the gold dust pure. The reduction of ores is effected either by direct amalgamation where the ore is generally free from any admixture of sulphurets. In this case, to liberate the gold from these combinations, the ordinary process consists in oxydizing them by constant stirring, at red heat, in presence of atmospheric oxygen, and subsequent amalgamation, the only objection being that from twenty-five to eighty per cent. of the precious metal is driven off in some unknown state of combination and loss—a loss which the most careful roasting has not hitherto been able to obviate or diminish. The admixture of "secret ingredients" to neutralize or destroy the tendency to volatize, is reduceable to a system of roasting, which substitutes a permanent mechanically porous structure for the ordinary routine of stirring—a system in use, as we have seen, among the Indians of Peru, in the sixteenth century, and practiced by Chaptal, in France, towards the close of the last century. The new processs known as the Rivot has partially been tried in Washoe, and which is on the eve to be fairly tested in these claims to overcome the above loss.

The chlorination process invented by Plattner has been successfully applied in this country by Mr. Deetken. Especial modifications to this process have lately been made in France on some gold assays rebellious to other treatment. The reduction of gold ores by fusion with lime and some other fluxes, has not been resorted to, that I am aware of, in this country. The method of amalgamation, though simple in itself, requires attention and care that is generally overlooked. The ore should be reduced to an impalpable powder. Grinding the ore with mercury should, under all circumstances, be avoided, as by grinding the mercury its effect is not only destroyed, but a large loss of the latter agent will be the result. The employ of pure mercury should be insisted on.

[To be Continued.]

A Novel Punishment.—The Carson *Post* says that the prisoners engaged in the stampede were compelled to each drive a nail into Miller's coffin, as each one might be considered as an accessory to his death. They were then required to place their hats on his coffin and escort him to his last resting place with the honors due to an honorable member of the fraternity of State Prison birds. Miller was a convict killed during a recent outbreak at the Carson Penitentiary.

The cost of half a mile of the London, Chatham and Dover Railway, north of the Thames, is $5,000,000, probably the most costly half mile of railway in the world.

[Written for the Mining and Scientific Press.]

Grass Valley Correspondence.

Editors Press:—We have had so many distinguished professors of mining and mineralogy, and mining experts, visiting us of late, and whose reports have been given through your valuable mining journal, that our people have begun to think this locality is attracting much attention from capitalists who have sent those experts to examine our mines. We are satisfied that they can come to no other conclusion than that this locality is second to none, for mineral wealth on the Pacific Coast. Our practical hard working miners, have proved this years ago, and have opened and developed their mines in spite of the many disadvantages they have labored under. It is to this class of men, and not to our professors (who we are sorry to see traveling in the wake of practical working men when we should look for them in the advance), that we are indebted for the development of this mineral field. Neither are our mines indebted to foreign capital, although we are satisfied that if our quartz men had enjoyed the great benefit of capital in opening their mines, we should have attained to our present enviable position *fully five years ago.*

The reports of our late visitors are correct in every particular, and we hope they will have a tendency to introduce capital here. We need it, and our mines will warrant large investments, if legitimately applied. Many of your readers who are conversant with these mines, and who know that a great number of our quartz men are rich, will say, "why do not these men who have become so rich at quartz mining open up the still undeveloped mines?" Our answer is, that most of them never dreamt of becoming so rich, and like poor, hard working men in general, they stick to their money like grim death. Not many weeks ago some of our persevering quartz men sold their interest in the Houston Hill mine, to a New York capitalist, for a sum of money that at present rates of dividends would be returned in ten months, with interest. The sum paid was a comfortable competence for them; they need never to bother their heads again in mining, so they are satisfied, believing they have enough. The ease will apply to nearly all of our rich quartz men.

I noticed an article in our local paper, the *National*, in which the assertion is made that we should not have had three paying mines at this time if it had not been for foreign capital. Such is far from the truth. We have about ten heavy paying mines in this district, the Allison Ranch, North Star, Rocky Bar, Massachusetts Hill, Pratt Co., Con. Riley & Co., Scadden Co., Houston Hill, Eureka, and the Lucky Co., *and we fail to see foreign capital in any of these mines.*

I am satisfied that there is not a more profitable field for the investment of capital than is presented in this county. The past history of quartz mining here should be sufficient proof that it is a paying institution. There have been some failures here, but those are easily accounted for. The Gold Hill Mining Co. is one of them; and its want of success can be readily accounted for without any admission detrimental to the character of our mines. The old Mount Hope or Rocky Bar Co., under the management of Mr. Brennan, was another failure, though not that the mine was worthless. During the time that dividends were being declared, he failed to prosecute work in opening up new mineral ground, consequently he soon exhausted his upper pay ground, and had to start the "deep shaft" after dividends ceased. Assessments were called for, which soon disheartened the stockholders; they abandoned the mine to Mr. Brennan, who being unable to work it, had to borrow funds on the machinery and plant, which soon fell into the hands of the mortgagee, who struck a rich lode during his first day's work in the shaft. Had Mr. Brennan seen to the opening of new ground while he had available funds from the mine, which every practical miner would have done, he would no doubt to-day have been reaping the fruits of such management, surrounded by the interesting family which he sent with himself to an untimely grave. This mine, as well as the Massachusetts Hill mine adjoining, have since proved to be rich, and have been opened and worked with credit to the owners.

Although much credit is due to the Messrs. Watt & Judd in proving the Rocky Bar ground, we have seen the time when a very little capital could have bought the entire of those company's property, even while there were unmistakable indications of immense wealth in view. It was fortunate that no enterprising, wealthy men, like those who bought the Houston Hill, appeared at such times, for the Massachusetts Hill Co. We are surprised that the above companies had not secured by purchase or location the grounds on the dip of their lode, now owned by the Stockbridge and Riley Co's locations which are destined to be equal in richness to the Massachusetts Hill Co's ground, as the last named company are within a few feet of their lines. But our home capital has such horror of quartz that it is not to be wondered at.

I shall be taking up too much space in your paper if I make this letter much longer, but will endeavor to continue my remarks some other time. I cannot close, however, without referring to that "Stock Board" project, which I am sorry to hear that you endorse. I do not believe that three intelligent miners, who have the interest of Grass Valley at heart, can be found who would countenance it. I suppose there are some parties here who would like to see the thing in operation as a means to get rid of their "wild cat."

In your last number, Feb. 4th, you are misinformed as to the Redan Co's mine being an extension of the celebrated Houston Hill mine. I do not know what fame it may give the Redan ground, by claiming relationship to the Houston Hill but I do know that it is not an extension of that hill. The Redan is the extension of Messrs. Watt & Co's Sebastopol mine. I hope we shall have fair sailing in all the mining enterprises about to start here, and that legitimate mining will be the only object of those interested. Speculative mining is "played out." With legitimate mining we are bound to realize large profits, while speculative mining is the ruin of men, and mines.

Grass Valley.

Grass Valley, Feb. 12, 1865.

[Written for the Mining and Scientific Press.]

From our Journeying Correspondent.

Ens. Press:—For the past week I have been traveling principally in a circle of five or six miles around Sonora, and within that space have found much to please and interest me. Leaving Jamestown on Monday morning, the first place of interest that I visited was the mine of the

TABLE MOUNTAIN TUNNEL CO.

situated at Humbug Hill, one mile north of Jamestown. This is one of the many tunnels that have been driven into the "Table Mountain" in the hope of finding gold, and one of the *few* that have been successful in finding it in paying quantities. Through the kindness of the Superintendent, Mr. W. L. Howes, I was permitted to examine this interesting mine very thoroughly. The tunnel penetrates the hill to the distance of twelve hundred feet, descending for the first three hundred with a grade of twenty-four feet to the hundred, but passing the rest of the way on a level. The loaded cars are drawn through the level portion of the mine by a mule, and up the incline by water power furnished by an overshot wheel of twenty feet diameter. The mine is drained by another tunnel opening lower down than the one through which it is worked, and about fourteen hundred feet in length. The stratum through which the tunnel is driven is of gravel, resting on a ledge of slate, and abounding in petrifactions of all kinds, the whole having the appearance of having been, at one time the bed of a river or other body of water. Below, is the irregular surface of the ledge of slate, while above, the dark lava walls of Table Mountain tower to the hight of hundreds of feet. The gravel is very irregular in its character, in some places having scarcely any gold, while in others, where the slate is traversed by narrow veins of quartz, it is of almost fabulous richness. After an hour both pleasantly and profitably spent, I took leave of my generous young friend and hurried on to fulfill an engagement to meet a friend from Sonora at

RAWHIDE RANCH.

Here, I met my friend Mr. Frye, of the Sonora Post-Office, and was by him introduced to the managers of the mine, Mr. Gillis and Capt. S. S. Turner. The mine is located on a continuation of the same ledge as that of App & Co., of Quartz Mountain, and bids fair to be richer than that famous claim. The rock is the richest that I have ever seen, every blast reveals more or less gold, and though they have gone down some eighty feet, it continues to improve. But though the mine is naturally so rich, it is not paying anything like what it should. The mill, of ten stamps, driven by water power, is a very temporary affair, and the power is very unsteady, sometimes driving the mill with a velocity apparently dangerous, while at others it lifts the stamps and drops them as if afraid somebody might be hurt by the fall. These defects, I was told by Capt. Turner, the company intend to remedy by building a new mill and replacing the water power by that of steam. The ledge has been opened on the surface in many places and several rich pockets have been found, from one of which over sixty thousand dollars was taken in a few hours. The scenery around this mine is of the finest description. It is situated in a valley of two or three hundred acres, surrounded on three sides by the dark lava walls of Table Mountain, and having all the natural requisites for a desirable home. In the afternoon, accompanied by Mr. Frye, I set out for Sonora, going over the top of Table Mountain, a field of great interest to me, but as it has been so often described in the California papers I will not attempt it again. Suffice it to say that we arrived in Sonora about sunset, in high spirits and with a good appetite and wishing that we could have such a trip once a week, at least.

Tuesday morning, armed with a letter of introduction from Mr. Wright of Sonora, to Major Holton of Columbia, I set out for the latter place. On my arrival I found the Major out of town, but as he was expected back in the evening I made myself at home and commenced hunting for old subscribers. The first of these I met was Mr. Morgan of the "What Cheer House," who had been a friend to Mr. Harnett when he was here last winter. Accepting his invitation to dine with him, I accompanied him after dinner to a mine (the Shanghai) in which he is interested. There is here a fine vein of gold bearing quartz, which affords fine natural facilities for working, as it is opened on the side of a hill, and no hoisting is required, the quartz being wheeled from the tunnel direct to the mill on a constantly descending grade. It is situated near the village of Yankee Hill, about two miles from Columbia. They have a five-stamp water-mill, well built, and occupying less space than any other quartz-mill I have ever seen. The average yield of this mine, employing four men, is about one thousand dollars per week, with which the owners seem well satisfied, as their investment has not been great.

On my return I met with a cordial reception from Major Holton, who had just arrived from a trip to a mine in which he owns an interest, situated some ten miles from this place. Calling on Major Holton the next morning by appointment, he proceeded to show me the "lions" of the place. I was much interested in the appearance of some of the ground which had been stripped by the hydraulic process of mining, which is much in vogue about Columbia. The limestone boulders which are thus laid bare assume a variety of fantastic shapes and seem like an army of giants clad in white robes, disfigured with spots of clay. Many of these boulders appear as though in imminent danger of falling, and I was told that miners unused to this work, find it difficult to watch unmoved the action of the water stripping the clay from their apparently tottering boxes. I am certain of one thing, that I should not relish being out among them in the dark. Major Holton spoke to me of a subject in which the miners of this part of the country are much interested, which is the comparative reliability of gold bearing ledges in granite or slate, which subject he wishes to see discussed through the columns of the Press. If such a discussion should be thought profitable, I shall be happy to present, from data now in my possession the geological peculiarities of the principal mining districts of Tuolumne county, together with the character of the mines, for comparison with those of any other part of the State, if by this means any light can be thrown upon the question.

My thanks are due to the numerous friends of the Press in Sonora and Columbia for favors received, and for the politeness which has been shown me wherever I have been.

Yours wanderingly.

Chinese Camp, Feb. 11th, 1865. D.

Tricks of Trade.—The Stockton *Independent* says it has abundant proof that the chief newspapers of San Francisco (the organs of the merchants), falsified the prices current in regard to grain, for the purpose of inducing farmers to send their grain into market some time back, and by such false representations they managed to obtain control of grain to considerable extent. The papers, by publishing grain at a higher price than it was selling, induced farmers to send their produce to San Francisco, and when they got it there they were compelled to sell it at much lower figure, or else submit to extensive losses.

Important to Tobacco Chewers.—Some rascally tobacconists in Philadelphia make a practice of mixing large quantities of sumac, which costs about three cents per pound, with their tobacco, and sell it, thus adulterated, as the genuine article. Smokers using this compound soon find themselves suffering from cancer and ulceration of the throat, mouth and tongue.

Flour for Distilling.—Ten thousand half sacks Chile flour, damaged by salt water, recently arrived in this city, have been purchased on private terms, by certain parties in the city, to be used for distilling purposes.

[Written for the Mining and Scientific Press.]

Letter from Sacramento.

Editors Mining and Scientific Press:—It is the general opinion of those outside of this city, and especially a certain clique that would rather see the fair Capital of our State inundated than not, that this is a doomed town. Nothing can be more absurd; and in order for one to be confident of this fact they must stay here a week and examine for themselves, as I have done. Sacramento has just passed through three of the hardest years that any city of its size ever experienced. By the untiring perseverance and energy of its citizens, the city front now stands above high water mark and the streets will soon be filled up to the same grade, or near it. The citizens of Sacramento have contributed more for beneficent purposes than any other place in the State taking all things into consideration; and wherever you find a man that is making more than expenses he never fails to come to time when called upon. Another evidence that Sacramento is destined to come out of the struggle all right, is the marked improvements that are now going on throughout the city. New brick buildings are being erected on all sides and old ones are being raised and repaired; but few empty houses can be found. Your fellow townsman Samuel Brannan, Esq., is here, and has commenced the construction of a large brick building at the corner of J and Front streets. Mr. Brannan is not one of those who are going to spend money building houses for the sake of getting up some morning in San Francisco to find them sailing down the bay.

The Masonic fraternity are also constructing a large edifice, under the name of the Masonic Association of Sacramento, incorporated September 24th, 1864. This association has purchased a lot on the corner of Sixth and K street, sixty by one hundred feet, and has commenced the foundation or basement story, which will be fifteen feet in hight to conform to the legal or high grade of the city. The size of the main building is sixty by ninety feet, and it will be three stories high. The first story will be for business places; the second for the Pioneer and City Library, and the third for two Masonic Hall rooms. The building and lot will cost, when finished, about $30,000. The contract is let to W. L. Heriden. Mr. Reuben Clark, the present Superintendent of the State Capitol building, is the architect.

Sacramento also affords two large foundries, one of which turns out as fine machinery as can be obtained at any foundry in the State. In order to make myself acquainted with the different departments of these foundries, I visited them, and was surprised to find that at Goss & Lombard's Sacramento Iron Works, they are over run with work. They are now constructing a large engine for the Savage Company at Virginia City; this is to be a Corliss walking beam engine, to be supported by two large cast iron pillars; the bed plate will weigh 5,500 pounds, with a 26-inch cylinder and six foot stroke. The engine when complete will weigh thirteen tons, and will be one of the largest, if not *the* largest, ever constructed in this State. One of Hansbrow & Reddings Hydrostatic engines will be built at this foundry during the summer.

I am informed that at the Union Iron Works, on Front street, owned by Williams, Heilbron & Co., that they are now building several engines for Reese River and for different parts of this State. This does not look much as if the mines were "petering out" or that Sacramento was gone or going in.

Sacramento boasts of one of the best mineral collections in the United States, or rather, one of her citizens boasts of it. This cabinet is owned by Dr. Frey, and contains over 4,000 different specimens, collected from all parts of the world. The Doctor has paid particular attention to securing his specimens, and has them all labeled and entered in a book kept for that purpose. Scientific gentlemen will find something of interest in visiting this fine mineral cabinet, on K street.

After spending several pleasant days here enjoying all the good things of life, including good living got up in the best of style by the gentlemanly proprietors of Toll's Hotel, where I can safely recommend all my fellow travelers to go, I feel about ready to plunge headlong into the mines. Traveler.

Sacramento, Feb. 8, 1865.

An Employment Bureau has been established in New York for the benefit of honorably discharged and disabled soldiers. The first applicant was a large railroad corporation, which wanted a first-class book-keeper. A lieutenant with a wooden leg took the position.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, FEB. 18, 1865.

The monsy market is abundantly supplied with available capital, and we have rarely had occasion to note so great an accumulation of unemployed means seeking investmeut, as at this time. Bank rates still rule nominally at 1½ per cent. per montb, but borrowers in good credit, and others with first class collateral, can readily negotiate loans upon more favorable terms.

Receipts of bullion, since Saturday last, amount to eight hundred thousand dollars. Gold bars, owing to the closing of the Mint, are rather more plentiful, and are worth about 850. Silver bars command from 1 to 2½ per cent. premium.

The Stock Market has exhibited more firmness than for some time past, and a number of leading shares are in better favor at enhanced rates. Comstock claims, with scarce an exception, continue to look more promising, and greater confidence is felt in their steady productiveness. The energetic development of these mines, during the past few months, seems to have revealed deposits of ore where least expected, and it is believed by some that future explorations will result as satisfactorily.

Speculative shares have been active, and large sales were made, for the most part at better prices. City stocks are also firmly held at quotations.

San Francisco Gas advanced to 85, and State Telegraph to 35, at which rates small sales were made. California Steam Navigation is held at 80, ex-dividend of two per cent. paid on the 15th inst. Spring Valley Water is inquired for at $47½ per share. The consolidation of this Company and the S. F. Water Works Company has been legally perfected, and the new stock of the Spring Valley Co. is being prepared for distribution among the shareholders.

Legal Tender Notes have been rather more active the past few days, and $100,000 have been sold within a range of 51 and 48 per cent., closing at 49 bid, 49½ asked. The latest telegraphic advices from the East quote gold in New York at 208 on the 15th instant.

Savage advanced from $1,565 to $1,625, b 30, and closes at $1,625 asked; 22 feet were sold. In view of the steady sales of a prominent holder of this stock, it has been well maintained. Work has been discontinued in the prospecting shaft sunk from the lower level, but the existence of a large body of good ore at that point is now satisfactorily demonstrated. At this depth the lode will soon be reached from the Company's main shaft.

Gould & Curry steadily rose from $1,565 to $1,650, and is now in request at $1,650 bid, $1,675 asked. Small sales have been made, for the reason that little or no stock is offering. The mine is said to be looking better than at any time during the past six months, and the receipts of bullion are averaging some $55,000 per week.

Yellow Jacket opened at $1,465, receded to $1,340, advanced to $1,455, rallied to $1,500, dropped to 1455, again rose to $1,500, and to $1,515, buyer 30, closing yesterday at $1,500; within this range 101 feet were sold. The affairs of the Company are assuming a flattering condition. On the 6th inst., after the payment of all liabilities, a balance of $40,000 remained at their credit in this city. The receipts of bullion so far, for the current month, have amounted to about $175,000, and a dividend of $75 per foot is confidently anticipated. The appearance of the lode in this mine is said to be very promising.

Belcher is in better favor, and small sales were made, advancing from $1,025 to $1,100. A balance of some $35,000 remained in the treasury of the company after the payment of the last dividend of $51 per foot, and the receipts of bullion since then are in excess of the same period in the month of January. At the close $1,100 bid, and $1,250 asked.

Challar advanced from $820 to 860, buyer 30, declined to $800, rose to $835, and closed at $830; some 50 feet have changed hands. The yield of the mine since the 1st inst. has been about $135,000. Some good ore bas recently been taken from the fifth level in the north mine, and it is said that the same level will be reached in the south mine in a few days. About 170 tons of ore averaging $46 per ton, are now daily hoisted to the surface. The quality of the ore found in the south mine is thought to be improving.

Potosi has been rather more active and 17 feet were sold, advancing from $730 to $800, slightly receding to $790, and closing at $775 bid, $800 asked. The product of the mine now exceeds 150 tons of ore per day, and the receipts of bullion during the past fifteen days amounted to $70,000.

Crown Point continues to improve and sales have been made at from $760 to $800 per foot, closing at $825 bid. In sinking from the 165 feet level, and in drifting south and west from the 260 feet level, promising bodies of ore have been met with.

Empire Mill & Mining Company was sold at $460 per share, ex-dividend of $20 per share paid on the 15th inst.

Ophir is in better favor and 21 feet were sold, advancing from $370 to $390. Work is said to be progressing vigorously in the old works of the Mexican Company.

Uncle Sam has been very largely dealt in at fluctuating rates, opening at $400, declining to $350, rallying to $395 buyer 30, dropping to $290, rising to $322½, and selling at the close at $250. Within this range of prices 339 feet were sold. Prominent holders of this stock have obtained a controlling interest in the stock of the Overman company, which it is supposed, will virtually terminate the litigation pending between these two companies.

Hale & Norcross, bas been dull and inactive at $220 to $230 per foot. An assessment of $50 per foot was levied on the 15th instant. Overman advanced from $140 to $205 per share bid.

Imperial has fluctuated but little and was steadily maintained at from $135 to $138 per share. The Alta mine is said to show material improvement. The company had a sufficient surplus on hand for the payment of a dividend on the 15th inst., but concluded to allow this fund to accumulate until the 3d or 5th proximo, when a dividend of $7½ per share may be anticipated.

Burning Moscow maintains its supremacy as a speculative stock, and 2,136 shares were sold; advancing from $55 to $72, declining to $60, rallying to $70, then selling at $35 seller 90, and $67½ cash, and closing at $66.

Bullion has been rather dull but advanced from $60 to $100, assessment of $20 delinquent.

North American has been in good request during the week and 600 shares were dealt in at from $28 to $31, closing at $27½ bid. Baltic declined from $35 to $25.

Sierra Nevada rose from $12½ to $22, dropped to $18, rallied to $20½, and sold yesterday afternoon at $18. In all 1,162 shares were sold.

Caledonia Tunnel rose to $8¼, and declined to $5. Wide West declined to $5½. Nevada, (J. G.) rose from $36 to $40. Real del Monte was sold at $9 and Daney at $5.

The aggregate sales of Stocks and Legal Tender Notes since Saturday last, were larger than usual and amounted to $656,070.50.

Commissions on Mining Shares.

Sale at 1 dollar up to 10 dollars, per foot	$0 25 per foot
Sale at 10 dollars up to 25 dollars	50 per foot
Sale at 25 dollars up to 60 dollars	1 00 per foot
Sale at 60 dollars up to 100 dollars	1 50 per foot
Sale at 100 dollars up to 200 dollars	2 50 per foot
Sale at 200 dollars up to 400 dollars	5 00 per foot
Sale at 400 dollars up to 600 dollars	6 00 per foot
Sale at 600 dollars up to 800 dollars	7 50 per foot

From $800 to $3,000 per foot, one per cent, on the amount of purchase or sale.

Anything above $3,000 per foot, three-quarters of one per cent. on the amount of purchase or sale.

FRANK LAWTON, Secretary.

J. B.E. CAVALLIER, President.

Mechanical.

THE PYROSOPHIC AMALGAMATOR.

This is the name of a new amalgamator recently invented by Mr. A. I. Frick, of this city. As the name implies, the process is conducted by the application of heat. It is also a dry one—that is, the precious metal is taken out from the ore without the aid of water. One of the conditions of this amalgamator is, that the ore should be crushed dry, and reduced to an impalpable powder, whereby all danger of loss of fine float gold, by water, is entirely obviated.

The amalgamator consists of an elliptical iron vessel, made to revolve on an axis. Iron plates, with longitudinal perforations, are affixed to the interior circumference, and also to the interior axis, and so arranged that when the sand falls from one of the plates attached to the circumference, it is intercepted by a plate affixed to the axis, and then reversed, which movement effects a complete and thorough agitation of the mass, presenting, at every change, a new surface of the sand to the action of the heat and quicksilver.

This cylinder is so mounted upon a furnace, which may be made of brick or stone, that the heat is applied to every portion of its outer surface. It is held in place by hollow journals, resting upon anti-friction rollers. Through one of these journals the quicksilver is introduced at the proper time, as given below, and to this journal the driving pulley is affixed also. To the other journal a pipe is attached, with a suitably arranged condensor, for collecting the quicksilver which may become volatilized and attempt to pass off with any moisture which may be liberated during the process. The machine receives its charge through a manhole properly secured in its circumference, and is discharged by the same opening. After the charge is placed, the cylinder is caused to revolve for about twenty-five minutes, when the mass becomes heated to the proper degree. The quicksilver is then added, through one of the journals, and on coming in contact with the heated ore is instantly divided through the same in a state of partial volatalization, and continued in that condition some ten or fifteen minutes, or until a perfect amalgamation of the precious metals has been effected. The charge is now dropped into an inclined trough, which carries it to any suitable separator for collecting the amalgam, after which the machine is ready for a new charge. An amalgamation can be made in from half an hour to a full hour's time. The concentration of the sulphurets which the ore may contain is effected subsequent to this amalgamation, and they may be afterwards worked by any process desired. One of these machines may be seen at work at the residence of the inventor, Second Avenue, Mission Dolores, in this city. The cost of one of the machines is within the reach of almost every individual miner The weight of the iron work of a machine of a capacity sufficient to amalgamate two tons of ore in twelve hours will not exceed 230 pounds, and can be divided so as to be easily packed. The furnace can be put up, by any one acquainted with such work, in a day, and can be laid up without the use of mortar. The preliminary steps for a patent have been taken through the Mining and Scientific Press Patent Agency.

We have personally examined the above machine, and have no hesitation in pronouncing it worthy the attention of our mill-men. The conditions under which the amalgamation is effected must commend themselves to every intelligent quartz miner. We see no reason why the amalgamation should not be as perfect and complete as it is possible for that operation to be made. In this machine, as in all others, practical and continous working must alone decide upon its merits.

The Mormon Temple now building at Salt Lake, when completed, will be capable of seating nine thousand persons. About the time it will be finished, Brigham Young and Heber Kimball's families will nearly fill it.

A Furnace for Burning Coal Oil under Steam Boilers.

Mr. John L. Linton, of Burlington, New Jersey, describes a newly invented apparatus for burning petroleum, or other hydro-carbons, for the purpose of generating steam. The chief feature of the invention consists in a peculiar apparatus for *mixing air with the vapors of the oil* for the purpose of thoroughly consuming the same. The apparatus is thus described:

At a situation near the boiler, and at the requisite elevation, a reservoir of iron or other suitable material is to be fixed, which reservoir is to contain the ignitable fluid to be used, from which a pipe conducts it to a large open vertical tube placed in front of the boiler, and above the top of the fire-box; at the bottom of this tube is a horizontal plate, forming with its two sides and a corresponding under-plate a projection into the upper part of the fire-box. The lower plate should, by preference, be made semi-circular at its rear end, and a circular aperture should be made therein to admit of the fixing therein of a vertical and conical pipe descending towards the lower part of the fire-box; a projection to the centre of this aperture serves to carry a small tube descending a short distance within the center of the conical pipe. The fluid descends into the open tube in front of the boiler, and on to the lower plate, whence it runs to the projection, and down the small pipe through the conical tube to the lower portion of the furnace or fire-box, the bottom of which is provided with a flat metal plate supporting two semi-cylindrical vessels or pans, so placed and fixed in contact that their line of junction is in a line through the center of the small tube down which the fluid falls on to their edges. These edges are serrated, or cut in channels, for the purpose of retaining portions of the fluid or oil, in order to vaporize the same. In order to guide the fluid to the central projection of the plate and down the small pipe, two oblique ridges are placed across the rear end of the plate, so as to oppose the passage of the fluid in the direction of the rear end of the plate itself. There is first to be introduced into the semi-cylindrical vessels, through the fire-door, some ignitable matter, which is to be ignited after turning on an artificial draft produced by a donkey engine, or by hand power. The oil or fluid is then allowed to flow from the reservoir into the open tube, whence it falls directly upon the bottom plate, and then down the small tube in the conical pipe upon the semi-cylindrical vessels at the bottom of the fire-box. The plate being heated by the flame, during the passage of the fluid or oil, sufficiently to drive off a portion of its vapors, which mix or commingle with the air during its passage over the said plate. A syphon pipe is placed at the top and front end of the boiler, and descending into the open tube, whereby a rush of steam and air results, and drives or forces the air and vapors of the fluid along the plate and into the fire-box. This vapor, thus charged with air, next comes in contact with the vapor generated upon the surface of the semi-cylindrical open vessels or pans, which charge the air with vapor to the point of combustion; it ignites and burns in the vessels, and continues as long as the same are supplied with oil or fluid. The flames fill the fire-box surrounding the upper and lower plates and sides forming the horizontal casing conducting air, oil, and vapor, into the furnace, and the flames also fill the tubes of the boiler with fire.

Los Angeles Inventions.—The *News* says that Mr. Daniel Sexton, of Mission San Gabriel, Los Angeles county, has invented and patented three useful articles. The first is a double piston steam engine, that does away with back action or pressure. It is constructed of straight "slabs," lying horizontally, of a square or box form, and so perfect in all its parts that no greater strength of material is required than for the common steam boiler and steam condensing pipe now in use.

The second is a cylindrical bellows or air-exhauster, for racking off wines and liquors, which is a most complete and ingenious affair.

The third is a faucet; the one exhibited to us is not a model, but a complete "boring machine," for boring, tapping, drawing fluids, and stopping up the incisions made, without losing a drop of the liquids, or admitting air into the cask or barrel which is assailed by the "deceitful fellow;" as the augur, etc., works—after the faucet has been located on the cask, which is accomplished by means of a plate fastened on the head, or other locality of the vessel containing the liquor, by means of thumb-screws—entirely within the faucet, and out of sight. The whole work of drawing is accomplished, from the beginning, in less time than an opening can be made, in the ordinary way, with an old-fashioned "tap-borer." The two last mentioned instruments are just what the wine-growers of California, and the world, have long needed.

Shankland's Locomotive and Track.

The Nevada *Gazette* gives the following description of this locomotive, to which we have several times alluded. It is made to run on a segment of a track, with a grade of two and a half inches to the foot, or eleven hundred feet to the mile. The locomotive and tender are of miniature size, but completely finished, and propelled by steam. The driving-wheels have cogs, beveled inward, fitted to the face of the inner rim. At the place where the steep grade is encountered, a double track is laid inside of the ordinary track, and on the outer side of these inner rails cogs corresponding with those on the driving wheels. These cogged rails are fastened with pivots to the cross-ties, and are braced with heavy spiral springs, so that they will yield to a lateral pressure, but are immovable in a longitudinal direction. By this arrangement, should the cogs on the track and those on the driving wheel fail to connect on coming together, the wheels are not stopped, but pass on between the rails until the locomotive can no longer climb the grade; the driving wheels, however, continue to revolve, though making no headway, and in a moment they so turn as to catch the cogs of the segment rails, and move on with as much power and speed as if they were upon level ground. The connection is so quickly formed after the onward progress of the wheels cease, that it is only noticeable by a slight jar when the rails spring into place, and by the accelerated speed of the train. In most localities a single track of cogged rail would be sufficient for all practical uses; but there are grades where a double track would be desirable, if not indispensable.

It is claimed by the inventor that this improvement is eminently practical and useful, and that it will, when introduced, exert a material influence on railroad interests; that it will do away with a large amount of expensive grading and tunneling, and permit the building of railroads over mountain ranges hitherto considered impassable by such means. We presume Mr. Shankland will shortly exhibit his invention in this city and Sacramento.

Wood vs. Iron.—The substitution of iron for wood in the construction of ships is going forward with such rapid strides in Great Britain, that in some of the old shipyards a timber ship is scarcely ever to be seen. It is a fact worthy of observation, that on the Clyde only two wooden ships have been built within the past year, out of an aggregate of 319 vessels launched there, or still in process of construction.

An "Elevated" Tea-Party.—A party of twenty-one persons, including one lady, dined one day last week upon the top of a chimney 120 feet in hight, which had just been finished by the Erie Railroad Company, at Susquehanna, Penn. The party were drawn up by horse power, and spread their repast on the top of the chimney.

A Ship-Building company has been organized in New York, with a capital of a million of dollars, of which David Ogden is President, for the purpose of building ships and steamers of all sizes, including merchant vessels, monitors, iron-clads, yachts, etc., upon the newly invented models of Captain Augustus Walker, of Buffalo.

[Written for the Mining and Scientific Press.]

More about Calvert's Process.

Messrs. Editors:—I still live to be, I hope, duly grateful for numerous and flattering notices of my poor efforts, by yourselves and correspondents. As it would hardly evince becoming respect to pass by so many polite attentions unnoticed, I must beg the privilege of once more saying a *few* words on a subject about which too much has already been *said* and too little *done*. I would observe to Mr. Rowlandson, that I do not desire "controversy," nor *notoriety*, and so decline the invitation, to parade my name before the public, who probably care nothing at all about it; yet, as he proposes, on that condition, to show the fallacy of my argument, I will make him an offer. The main point in that argument, was the statement that Calvert had actually operated on "natural auriferous quartz," from which he "easily extracted the two ounces of gold per ton which it contained," a fact thus far utterly ignored by Mr. R. whose whole argument proceeded on precisely the opposite assumption. Now, if the gentleman will promise to show a "fallacy" there, I will agree to repent the statement, with my inference therefrom, over my own name. If Mr. Rowlandson really desires to act with "perfect fairness" as he says, let him frankly confess that he, intentionally or not, entirely misrepresented the Professor's experiments by omitting to notice the most important part thereof, and pronounced upon a subject which he did not understand; a judgment which even "Delta" is able to show to have been wrong, as, indeed, he might have ascertained beforehand by taking the course so kindly recommended for my benefit, of applying to a "practical operator" for facts.

I observe that "Delta" sustains Mr. R's views in part, though not the conclusion at which that gentleman arrives. Now, if "Delta" considers himself a chemist or metallurgist, I, being an humble student of those sciences, would like to ask him a few questions, premising that I did not, as he states, *deny*, but only *doubted*, the formation of hydrochloric acid in the case alluded to, and I do not see that its production in Plattner's process has any bearing on the question as the *conditions* differ widely.

"Delta" further says sulphide of gold *is* formed, as supposed by Mr. R., to which conclusion, he is led by the astonishing fact that he failed to detect metallic gold in a substance from which he had already extracted the greater, and doubtless most exposed portion of that metal; a logical inference truly! Next comes a rather muddled explanation of the effect of chlorine on "sulphate of protoxyd of iron," which would do very well, but for the circumstance, perhaps unknown to "Delta," that sulphureted hydrogen, which he insists is formed, reduces the peroxyd of iron to a protoxyd. The questions I wish to ask this writer are:

1st. Who made the discovery that chlorine gas could be "generated *from* dilute sulph. acid?"

2d. How strong is "strong chlorine gas," and how may it be distinguished from chlorine gas that is not "strong?"

3d. Was it not chloride of *silver* instead of "chloride of gold" which, by forming an insoluble crust on the particles of "gold, coarse and alloyed with silver," obstructed the process of chlorination?

The fact is, as I have before intimated, it is idle to speculate on the various reactions which may or do occur in Calvert's Process." Suffice it that, if properly conducted on suitable ore, the ultimate result is the solution of all, or nearly all the gold. I shall take an early opportunity to test the matter practically, when I will make the result known through the Press.

C. A.

Now in Its Tenth Volume!

— THE —

Mining and Scientific Press,

— THE MOST —

Profitable Newspaper

— FOR THE —

Readers of the Pacific Coast.

Issued Every Saturday Morning.

DEWEY & CO., Publishers.

Our Journal enters its Tenth Volume with marked prosperity and improved facilities and resources for furnishing a handsome, valuable and well filled sheet.

We believe that the Press furnishes more information of ready application and intrinsic value to its readers than any other journal on this side of the Continent. Its circulation has doubled during the past year, and, for the economy and interests of the industrial classes of this and neighboring States, its subscription list should be more than trebled for the ensuing twelve months.

We shall continue to make the Mining and Scientific Press substantially

An Instructor to Prospectors,
An Economist to Millmen,
An Assistant to Active Miners,

An Economizer for Mining Advertisers,
A Reliable Reporter for Shareholders,
A Faithful Monitor for Stockdealers,

An Intelligencer for Mechanics,
An Incentive to Inventors,
A Reflector for Patentees,

And a Helpmeet to all Industrial Classes

Upon the Pacific Coast. We shall give accurate and frequent

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

Friends pleased with our efforts in the publication of the Press can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

SUBSCRIPTION IN ADVANCE.

One Year, (two volumes)..... $5.00
Six Months, (one volume)..... 3.00

FOR ADVERTISING

Our terms are very reasonable. Mining Companies are especially favored by our rates, and careful attention is given to the publication of Mining Notices.

Office in Government House, Nos. 11 and 56, corner of Washington and Sansome streets, San Francisco.

One copy, six months, in advance..... 3 00

☞ For sale by Carriers and Newsdealers. ☜

It is Impossible for editors to know all the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventions can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we shall furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:
Saturday Morning, Feb. 18, 1865.

Canvassing Agents.

We would call attention to the following named agents of the MINING AND SCIENTIFIC PRESS as gentlemen worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the Press, will be acknowledged as a personal favor to us:—

Wm. R. Bradshaw—San Joaquin, Calaveras, Merced, Tuolumne, Stanislaus and Mariposa counties.

Mr. Robert Lattimore—Butte and Yuba counties.

J. M. Wolf—Sacramento, Placer and El Dorado counties.

HOW TO UTILIZE SAGE BRUSH.

Experiments have abundantly proven that most of the sage brush land on the Plains is capable of producing most excellent crops of either cereals or roots, wherever irrigation can be applied. It is now proposed, in Humboldt, to convert some thousands of acres of this land, along the Humboldt Canal, to such purposes—the water of the canal to be used for irrigation. Some profit, it is thought, may also be derived from digging up the stouter portions of the brush and hauling or floating it in barges to the mines for fuel for generating steam or roasting sulphurets, for both of which purposes it fully equals the best quality of wood.

There is no reason why even the lightest portions of the sage brush, where it can be collected in large quantities within five or six miles of a market, may not be utilized and made valuable for fuel alone, aside from the further profit to be derived from the clearing off of the land. There is a hay press in this city, known as the "Beater Press," which is advertised in our columns, and which was fully described and illustrated in our issue of January 14th, that is now used in some parts of the Atlantic States, for pressing shavings into kindling wood. They are so firmly pressed that they can be sawed into blocks, like timber. The same press will make an equally solid mass of the finest sage brush; while the larger portions can be culled out and piled up after the ordinary manner of cord wood.

The finer portions can thus be hauled quite as cheap as common wood, and can be pressed into shape as fast as the other can be cut and corded. We have seen common oat straw so firmly pressed by this machine that letters could be carved upon it with as much facility as they could be on a soft pine board. Sage brush could be treated in the same manner. Thousands of acres might thus be cleared, and the labor of doing it made remunerative rather than expensive. We would call the attention of the proprietors of the "Beater Press" to this, as it seems to us, large field of usefulness and profit for their machine.

THE COST OF FINERY.—It appeared by official statement, a few years since, when the people were in the hight of the railroad excitement at the East, and were importing railroad iron in immense quantities, that the duties paid on artificial flowers alone, exceeded that paid on all the railroad iron imported!

IMPROVEMENTS IN HORSE SHOES.

The horse shoe, its form and make, has been a matter of more or less study for centuries. Bridge and road engineers have devoted much study to produce a shoe that will not cut up the roads and pavements. In this direction there is yet a fair chance of profit to any one who will invent a shoe that can endure the destructive effects of rough pavements, not slip on smooth ones, and yet not damage good macadamized roads.

Among the devices to avoid slipping on smooth pavements, steel spurs have been prepared which will constantly pick the pavement and keep it rough. Frankincense has been used on one side of the spur to keep up a cutting edge. Gutta-percha has been proposed as assimilated to the hoof, to which efforts have been made to attach them by marine glue. Emery has been mixed with the gutta percha. Nothing, however, has yet been found to work as well, under all conditions as the ordinary iron shoe.

The only real progress which has been made in the manufacture of horse shoes appears to be an apparatus for which letters patent were issued to Morgan Chittenden, of Danbury, Conn., Oct. 11th, 1864. This invention consists of a *moveable shoe*, which may be put on and off almost as readily as a man may change his boots. This shoe is nothing more than a sandal, with an iron sole, an iron toe and heel piece, secured by two straps reaching from the heel piece upon either side of the foot, and secured to an upward projection from the toe-piece upon the front and near the upper portion of the animal's hoof.

The advantages of this improvement are stated by the inventor substantially as follows:—

The shoe can be put on and off at pleasure, and a sharp shoe exchanged for a smooth one, to suit the weather. A gutta-percha shoe may also be readily exchanged at any time, for an iron one, if desired. When not in use, the horse can stand without shoes, giving the foot a chance to rest from the binding influence of the common shoe, and regain its natural state—one great object. The shoe being neatly fitted, so as not to bind unduly anywhere, is kept right by the natural growth of the hoof, which can be kept in shape by the rasp or knife with little trouble. The hoof being narrower behind, of itself prevents the foot from sliding backward in the shoe, and it is only necessary to keep the heel up to its place, which is done by the band; any pressure on the top of the foot by the hand is obviated when the weight of the horse is on his feet by the natural settling of the foot in the shoe. Finally and not least, it preserves the hoof in its natural state, and gives to ailing hoofs a chance to recover.

ANOTHER UNDERGROUND ENGINE.—We made a notice, some weeks since of a large steam engine which had been placed in a chamber of the Gould & Curry mine, at a depth of over 400 feet below the surface. The steam for driving this engine, however, was generated in boilers upon the surface, and carried down through a long steam pipe.

The Territorial *Enterprise* says that they have now placed a second engine, at 250 feet below the surface, which has its boiler also by its side in the depths of the mine. The smoke stack of this engine is probably the longest in the world, being two hundred and seventy feet in length. This long stack passes up through one of the compartments of the shaft and out through the roof of the hoisting house, carrying the smoke from the furnace below and also the escape steam from the engine. The engine has been placed in a gallery which connects with a shaft, and is used for pumping. The foundations are being laid near the mouth of the shaft for a large Corliss engine of 100-horse power, which will shortly be erected for hoisting and pumping. It is the intention of the company to sink this shaft to the depth of over one thousand feet below what is at present their lowest working level.

FOUR YEARS. TO-DAY.—Jeff. Davis, if he still retains his hold upon power, will, to-day, have completed just four years of his reign of terror in the Southern States. When will the end come?

PETROLEUM AT THE EAST.

An Eastern paper remarks, that those who are unacquainted with the facts in connection with the discovery and development of oil in the United States, an exhibit of the actual production of oil furnishes material for important reflection. The people of California are becoming interested in this subject also, and we present some statistics that may be relied upon. The business has already become so extensive at the East that petroleum furnishes a portion of the exchange with foreign countries, which was lost in the cotton kept out of the market by the rebellion. In 1862 the entire exports amounted to 10,182,020 gallons, in ten months of 1863 to 26,070,569 gallons, and since January 1st, 1864, to 30,182,020 gallons.

The estimated value of the petroleum found in Pennsylvania during the last twelve months, is two millions of barrels, which at eleven dollars a barrel, a high average, was worth at the wells, twenty-two millions. The pig iron interest of Pennsylvania during the same time amounted to 700,000 tons, which at an average of $50 per ton, produced $27,500,000. The coal product for the same period, in estimated at 12,000,000 tons. This at an average of $6.50 per ton, would make $78,000,000. The grand total of coal, iron and oil would therefore reach the enormous sum of $130,000,000.

The figures show that petroleum, which has been, comparatively, but a short time in development, promises in the course of the next few years to take precedence of both iron and coal in the State of Pennsylvania.

Arrangements are being made in Pennsylvania, it is stated, to sink a vast number of wells during the coming summer, so that in one year from this time, the number of wells likely to be in operation, will be very largely increased; perhaps to fourfold those now flowing in that State. In addition to this the regions in Southern Ohio, Western Virginia and Eastern Kentucky promise to make vast additions to the amount of oil already produced. No one can form an an adequate idea of the results to be attained during the next year or two. A good export demand for this commodity will materially aid in keeping down foreign exchange, besides adding immeasurably to the productive interests of the country.

INTELLIGENT FARMING.—Mr. Wm. Boots, Alviso, Santa Clara, realized $5,000 the past season, from his crop of potatoes, the result of irrigation. There are hundreds of others in the State, whose crops were destroyed by last season's drouth, who might have done equally well, had they but properly prepared themselves for irrigation, as they might have done. There is no land in the world more capable of producing fine crops than much that has entirely failed the past year in California. Why do men starve themselves and their cattle, when they have thousands of acres capable of being made to produce unfailing crops, bounteous in quantity? With a little well directed effort, there might have been beets and carrots enough raised in the vallies, the past season, to have fattened every animal which has been allowed to starve during that time. When will the ranchmen of California learn wisdom and humanity.

A READING PEOPLE.—The people of Nevada county support four daily papers, all of which are doing well. San Francisco with all her wealth and population, has but four dailies printed in English; no other county in the State has over two. The people of Nevada county are a reading people. In no other interior county is the MINING AND SCIENTIFIC PRESS more appreciated. Nevada county furthermore leads all other counties in the State in the extent and efficient character of her quartz mining operations. The key of this success is plainly attributable to the intelligent manner in which her mining men carry on their work.

IT is estimated at Washington that there are eleven million bales of cotton remaining in the Confederate States. Uncle Sam will have it.

PROFESSOR BLAKE—THE PROPOSED MINING BUREAU.

Among the departures by the last steamer we notice the name of Prof. W. P. Blake, of this city. The Professor goes East on business, and will return in June or July. Should he be able to visit Washington, during the pendency of the discussion of the Mining Tax Bill, and that in relation to the establishment of the Mining Bureau, he will be of much service to the Pacific Delegation in aiding them to place those important subjects before Congress in their proper light. We have had no scientific man in the State who has taken so much pains to inform himself, or who has collected such an amount of valuable information and statistics, in relation to our mines, as has Prof. Blake. Our personal acquaintance with him enables us to speak advisedly of this matter, and to state that his views are eminently practical. With regard to the proposed establishment of a Mining Bureau, we know that he has given the subject much thought, and we fully believe no man in the Union is better qualified to arrange the details of such a Department, or to take the charge of it when established.

With regard to the importance of such a bureau there can be no difference of opinion among those acquainted with our general mining interests. We take it for granted that every intelligent man will admit that the National Agricultural Bureau has performed important and valuable services in the department of science devoted to agriculture, by explaining and comparing the methods of cultivation and tillage as adopted in different sections of our country and abroad. It is scarcely necessary to state that if such a course has rendered important services in so familiar a pursuit as agriculture, a similar policy in reference to mines, mining and minerals—subjects which are but commencing to assume their destined importance, and with which the great mass of the people are absolutely ignorant—must redound to national as well individual benefit.

When it is taken into consideration that the mines of this coast, though yielding nearly sixty million dollars' worth of the precious metals annually, might be made to produce nearly half as much more, which difference is absolutely thrown away for want of the necessary knowledge of how to save it, no further argument need be advanced to prove the necessity of information such as the contemplated mining bureau will furnish.

The operations of the agents of this bureau will not be conducted on the same system as our State Geological survey, which is purely scientific in its scope and plans; but all its operations will be made to spread the light of science before the people in the most popular manner. Lecturers of experience and ability should explain to the miners in their various localities, the nature of the minerals they seek, and the best methods of finding them. The various agents of the bureau will be provided with laboratories and apparatus, where those who desire such information, may, under certain restrictions, perform experiments or observe the processes of others who do so. It is not possible to over-estimate the benefit such a system would confer on the miners of this State. If such a bureau had been established ten years ago, millions of dollars which were expended in useless machinery, blind prospecting, and worse than useless mining, would have been saved; the product of our mines would have been greatly increased in value, and many valuable minerals, at present passed by as worthless, would have been found to be of much importance, while "wild cat" would never have scratched so many victims, who have suffered through a lack of knowledge of mines and mining.

THE telegraphic service is now finished from St. Petersburgh to the frontier of China. The total length of the line is 3,398 miles. The works have all been completed in three years. They will soon be extended across the narrow arm of the ocean, near Berrings Straits, and thence be continued down the coast through the Russian and British Possessions to California.

EL PASO REDIVIVUS.

Our correspondent writes us as follows, with regard to the resumption of work at El Paso:

"With much pleasure, I am able to state that a new party has commenced operations in El Paso District, under the superintendence of Messrs. Malin, Milliken and Tappan, (all El Paso pioneers,) the funds being furnished by Henry Edwards, Esq., of Boston, Mass.

"They have contracted to sink upon the Milliken Lode one hundred and fifty feet, if necessary, to fully develop its value. They have plenty of supplies, help and tools, to accomplish the work.

"Feet are taken in payment for all the labor, transportation, &c., also for the cash advanced for supplies. This enterprise presents the most hopeful prospect of any yet attempted in our district, and thus far is the only one commenced in the right direction on any silver lead, excepting a forty foot shaft on the same lead by Messrs. Warner, Milliken and Toberman, last winter, at the bottom of which the present party commenced operations.

"From August last to the sixth instant, the district has been entirely abandoned. Now, the boom of the blast, the ring of the drill and of the blacksmith's anvil, greet the ear, and Laurel Hill again presents the lively aspect of former times". C. W. T.

January 23, 1865.

GOING EAST.—We regret to learn that Mr. L. W. Taylor, the gentlemen who owns the superb cabinet of minerals, noticed some time since as on exhibition at the Government House, in this city, has decided to take that valuable collection to the East. He leaves on the next steamer. We had hoped he might have been induced to pitch his tent permanently in this city. However, the regret at his leaving is in a great measure compensated in the fact that he proposes to put up his cabinet in New York, where it will be placed on exhibition as a representative of the rich and varied mineral interests of California. It is Mr. Taylor's purpose of open, in New York city, a General Mining Agency Office. His long residence in California (since 1849,) and his general knowledge of the mines and the operations of our mining companies, and his proverbial reputation for honesty of purpose, especially fit him for usefulness in that direction. Our New York friends will find Mr. Taylor's cabinet well worth examining and studying. His collection of stephanites, one of the rarest ores of silver, cannot be duplicated on the continent. His collection of rarely found natural crystals of gold, native amethyst, chalcedony, agates, jaspers, and other beautiful and rare minerals are superb. He also takes the finest collection of copper specimens yet carried East. His specimens of tin and its ores, coming from this coast, will doubtless surprise our New York friends.

"FEET" VS. "FOOT" POUNDS.—Our correspondent "C. A.", in reply to our item, "A Corrector Corrected," says:

As to the matter of 'feet-poands,' I will simply state that Webster gives the term as a single compound word, of the same class as footstool, foot-note, etc., of which the plural must, by all rules, be formed by adding "s." Moreover, the term signifies an expressed number of pounds raised *one* foot, not two or more feet.

We have named one of the most scientific German writers as our authority for using the term "*feet*-pounds." Our correspondent prefers the *dictum* of a mere philologist for his mode of expression. Further discussion would be unprofitable, perhaps, and we drop it.

"THE CALIFORNIA RURAL HOME JOURNAL" is the title of a new quarto sheet which has appeared in this city the past week, under the editorial charge of T. Hart Hyatt. As its name implies, it is chiefly devoted to agriculture, is neatly printed, and gives promise of ability and usefulness. It is issued semi-monthly, and contains a large amount of choice reading.

SYDNEY papers state that a new gold field has been discovered near Rockhampton, Australia.

[Written for the Mining and Scientific Press.]

Report of our Experiments with Baux & Guiod's Pan.

MESSRS. EDITORS:—In accordance with what I believe to be your desire, to publish all the *facts* which may be of service to those in search of suitable machinery for metallurgical purposes, I send you the following report of a practical test which I have just made with the above pan.

The ore operated on was a roasted silver ore, of which five hundred pounds were worked in a very satisfactory manner, in two charges of two hundred and fifty pounds each, giving twenty-six pounds of amalgam, which yielded 71½ per cent. of the precious metals contained in the ore, as indicated by assay before roasting; a very satisfactory result considering the nature of the ore, which consisted of arsenical pyrites, antimonial galena, zinc-blende, and a small quantity of calamine in a quartzose gangue.

Numerous examinations of the tailings, as they passed off, with very few exceptions, failed to show the least particle of mercury, and when the discharge was complete, and the cover taken off, not more than four pounds of sand remained in the pan. The complete discharge of the machine occupied from four to five hours, though a less time suffices when it is to be re-charged without cleaning up.

In working gold quartz, for which this pan is more particularly designed, this time need not be lost, as it is intended to feed and discharge continuously, and in this way it might be advantageously used as a separator, in connection with other machines. With silver ore this continuous working is obviously impracticable on account of the necessity of allowing time for chemical action.

The machine certainly does its work in a thorough manner, which goes far to prove the practicability of amalgamating without *mixing*, not to say grinding, the mercury with the pulp, in proof of which I will state that a quantity of copper which was precipitated on the upper surface of the muller arms, was found almost untouched by mercury.

The fact that this pan performs, in a highly creditable manner, the three-fold functions of grinder, amalgamator and separator, adapts it especially to the purpose of testing distant mines at small expense, as a single one of them, in connection with any suitable crusher, forms a small, but effective mill. C. A.

GREAT WESTRN TUNNEL AND MINING COMPANY.—We have recently seen a private letter from Esmeralda, giving a favorable report with regard to the progress of work upon this tunnel. The rock in the tunnel is now found softer, and interspersed with small veins of quartz, which is considered a good indication of a near approach to a main lode. The Board of Trustees are in earnest in prosecuting their work, and as energetic, persevering men, we trust they will meet with a deserving reward.

GEO B. RICH & CO.—We would call the especial attention of our readers to the card of Geo. B. Rich & Co., Real Estate Agents and General Auctioneers, which will be found in our advertising columns to-day. They may be found at 605 Clay street. All business entrusted to them will be promptly and faithfully attended to.

STRUCK THROUGH.—We understand, from private correspondence, that the workmen in the shaft of the "420" mining claim, on the Comstock lode, near Virginia City, have cut through into the Bullion works! The shaft is five hundred and eight feet deep. What are the Bullionites doing under the "420" shaft?

AN IMPORTANT MOVEMENT has been initiated at Salt Lake, which consists in the organization of a Christian Church, of the Congregational faith, in that city, which will be the first organization of the kind in Mormondom. The "Gentiles" are seriously encroaching upon the peculiar institutions of Brigham Young.

WALTER S. DENIO, Melter and Refiner in the U. S. Branch Mint, died in this city on Saturday morning last, of congestion of the brain. Owing to a disagreement between the Superintendent and Sub-Treasurer as to the appointment of a temporary successor to Mr. Denio, business is suspended at the Mint for the present.

A BRIDGE to cost $10,000 is to be built across Pajaro River, opposite Watsonville.

LEAD.—The demand of lead for consumption has been very steady during the past year. The importations for the year amount to 27,900 tons—an advance of 7,000 over the average of the three previous years. The receipts of galena, during the same time have been been 1,300 tons—less than the average of the three previous years. During the last year government has consumed about one half of the entire delivery of lead; the consumption for ordinary purposes showing a large falling off. The price of lead during the last nine months has been below the cost of importation, and it did not advance at any time during the last year in proportion to gold. It opened on the 1st of January at 10¼c., advanced to 16½c. in July, declined in September to 13½c., and since October it has fluctuated between 14½c. and 15½c. in currency.

AN ODD LARCENY.—An old colored women in this city had a set of false teeth stolen from her mouth, last week, while she was asleep! The teeth were subsequently found at a pawnbroker's establishment.

COPIES OF THE MINING AND SCIENTIFIC PRESS of January 28, 1865 (No. 4, of Vol. X), are wanted at this office, and for which we will pay full price.

[ADVERTISEMENT.]

To the Public, and to Millmen in Particular.

As Thomas Varney has not, up to this date, withdrawn his notice to the "Mining and Scientific Press," in which appears the following language:—

"All persons are warned against purchasing machines made at the Miners' Foundry, called 'Wheeler's Amalgamators,' as they are an infringement on my patent, and a suit is now pending in the United States Circuit Court, against the parties infringing;"

In justice to myself I am compelled to give to the public a statement of the facts in the case, and show the position which Mr. Varney and myself occupy as Patentees. He commenced suit against me, and the Miners' Foundry, for $30 000, about the 1st of March 1863, and threatened suit against any and all persons who should buy my Amalgamators, thus greatly damaging my business. To show the injustice of this suit against a "poor hard working mechanic," I will quote from the opinion of Judge Hoffman, as rendered in the case last November. He says:

This is an action for the infringement of a patent issued to the plaintiff on the 16th of December, 1862, for an "Improvement in Amalgamators for gold and silver." The machine alleged to be an infringement has also been patented—the patent being dated December 8th, 1863. The defendants deny the alleged infringements, and the novelty and originality of the plaintiff's invention. They have also given notice, under the statute, of various other defences, hereafter to be noticed.

Models of the two machines were exhibited in Court, and a large number of witnesses called to explain their construction and mode of operation. It is apparent that the patented machine of the defendant closely resembles, if it be not substantially identical with, the improved and modified machine now manufactured by the plaintiff. But the inquiry is not whether Wheeler's machine resembles that lately used by Varney, but whether the former is substantially the same as the machine described in Varney's patent. That Varney has, in many important particulars, modified the machine as described in his patent, is obvious. Indeed, his late machines resemble much more nearly in external appearance, and in their mode of operation, the Wheeler patented machine than they do a machine constructed according to the drawings and specifications of his patent.

After describing Mr. Varney's pan and its operation, the Judge says:

It appears, however, that the idea of working ores in a batch, by causing them to pass repeatedly between mullers, the upper one of which is provided with openings at the center, is by no means novel.

J. E. Clayton testifies that, so long ago as 1845, he arranged a machine in Tallahoosa, Alabama, for the reduction of gold ores, which embodied substantially the same principle.

* * * * * * *

In Overman's Metallurgy, p 267, a similar arrangement is described. * * * It is evident that the author is here describing an existing and well known machine, the usefulness of which has already been ascertained.

It is also apparent that the result aimed at is the same in this machine as in that of the plaintiff, and that the means adopted to accomplish it are substantially similar. In both machines the pulverization of the ore is effected by means of a bed plate upon which a muller rotates, with central openings to permit the pulp to pass continuously and repeatedly between the grinding surfaces until the operation is completed.

Amongst other things the Judge quotes the following from Judge Story:

But in all cases where the patentee claims anything as his own invention in his specification, Courts of law cannot reject the claim, and if included in the patent and found not to be new, the patent is void, however small and unimportant such asserted invention may be.

* * * * * * *

Here the plaintiff claims a particular position of machinery as his invention, and it clearly appears in evidence that the position is not new. It has existed before—not in machines exactly like the present, but in machines applied to analagous purposes, viz: in machines applied for the same purpose as the plaintiff applies them. The objection therefore, is fatal.

In the defendant's machine, the pan in two parts, provided with flanges, packing, &c., to which the plaintiff in his patent attaches so much importance, is not used, but a deep pan is substituted with a wooden cover.

The arrangement of the slots or sloces on the muller is different. The upper muller is provided with spiral ridges arranged to operate with similar ridges reversely inclined on the inner surface of the pan, to raise the pulp and promote the circulation. The upper muller is attached to the shaft by an universal joint, and by a mechanism quite dissimilar to that described by the plaintiff. And for the scrapers are substituted broad guide plates extending and secured to the edge of the pan, and capable of being elevated or depressed by means of a mechanism not found in the plaintiff's machines.

Assuming then—as in the point of view in which we are considering it we must—that each of the several parts of the plaintiff's machine is old, and not separately patentable, it seems clear to me that if the patent for the machine can be sustained, as for a new combination; which I think doubtful, the combination of the defendant is at least as novel as that of the plaintiff.

We have already seen that the muller rotating upon a bed plate, with central openings, and arranged in a pan so as to create a circulation of the pulp, is not a new invention. The tub, composed of two parts, with flanges, packing, &c., is not claimed to have been used by the defendant. In fact it is now discarded by the plaintiff, and a deep pan, with muller attached by an universal joint, has been adopted by him in his later machines. The infringement, if any, must consist in the use by the defendant of the scrapers described in the plaintiff's patent.

The inquiry thus arises—are the curved plates described in Wheeler's patent, substantially the same in their structure and operation as the scrapers of the Varney patent, and if so, do the latter constitute a "material and substantial part of the things patented by Varney, definably distinguishable from the other part." To determine this question, a brief description of Wheeler's machine is necessary.

The Judge then describes the Wheeler pan and the Varney pan and scrapers, and says:

In the Wheeler pan four plates are used while Varney employs only two scrapers. The form or curve given to these plates in both machines is similar, though not identical; but in their structure, arrangement, and the use for which they are intended, there is an essential difference. The scrapers of Varney are represented as of inconsiderable width, and extending from a ring at the center to the periphery of the muller. They rest apparently upon the surface of the muller, and no means of elevating or depressing them are mentioned in the specifications or exhibited in the drawings.

The plates of Wheeler are of considerable width, and attached to a frame suspended from the top of the shaft, resting upon a vertical screw, by means of which the frame and plates attached to it may be elevated or depressed. The plates extend to the inner surface of the pan, where they are secured by slides. The office of these plates, as described in Wheeler's patent, has already been mentioned. It appears to me that the scrapers of Varney neither serve, nor were intended to serve, any such purpose. [Here the Judge gives his reasons for the above opinion.]

For these reasons I am of opinion that the curved plates of Wheeler differ from the scrapers of Varney in their form and arrangement, their object and effect, and that therefore their use is not an infringement of Varney's patent.

Much testimony was taken to show that in fact Wheeler's invention was prior to that of Varney's and that the latter derived his ideas from the former

It is claimed by Varney that his invention was, in its essential features, matured and perfected in August, 1861 But the statement seems hardly consistent with his declarations or his conduct.

Varney's application for his first patent was not made until the end of October, 1861. That machine has since been discarded as useless.

It then, at the time of this application, he had already matured and perfected the invention of another and far better machine, he committed a practical fraud upon the public in withholding from them the benefit of his skill and ingenuity. It is certainly strange that he should have gone to the trouble and expense of procuring a patent for his first machine, and delayed, for nearly a year, his application for a patent for the improved machine which he had, as he says, already invented.

It may well be doubted whether, if it be true as Varney states, that at the time of his application for his first patent he had already completed and perfected his improved machine, he suppressed would not be fatal to both. It appears in evidence that, so early as December, 1861, Wheeler had conceived and communicated to Stewart & Kirkpatrick at Washoe, the idea of his machine. He explained to them the mode in which the circulation, or over and under current was to be produced, and the guide boards by which it was to be assisted.

In January, 1862, drawings of this machine were received at the Miner's foundry, and Stewart, the partner of Churchill, was desirous of having his pans constructed on that plan. The theory and genuine ion of the proposed pan were fully explained to Varney, who succeeded, however, by adleting to consider Wheeler's pan a "humbug," in dissuading the parties from adopting it, and in inducing them to order pans made on the model of his own patent. These were subsequently discarded as useless. We are driven to adopt one of two suppositions: either that Varney wilfully deceived Stewart in inducing him to order an inferior pan, or else that he had not at that time discovered the mode of producing the over and under current, recognized its utility and invented a machine to effect it.

Wheeler commenced manufacturing his machines in January, 1862. He commenced using them in June of the same year. They were constructed at the Miners' Foundry by the defendants to this cause, under the immediate observation of Varney. But in his conversation with Scott, in July, 1862, and in his communications with the defendants, he does not appear to have intimated that he was the first inventor of the Wheeler machine, and that in constructing the latter they were violating his rights. Up to the end of 1862, he continued to have his own pans built at the same foundry; and if he really considered the construction of Wheeler's pans to be an infringement of his own invention, his silence is inexplicable. His delay in applying for his second patent is equally unaccountable. In August, 1861, he had, as he says, completed and perfected his invention of his improved machine, and yet in October of that year he applies for a patent for his first and imperfect invention, and delays his application for a patent for his improved and perfected machine until the end of June, 1862—more than a month after Wheeler had taken the preliminary steps to obtain his patent.

It is unnecessary, however, to pursue this inquiry further, for in the view I have taken of the case the question of priority of invention is immaterial.

The Judge then notices the other grounds of defence, and says:

If this view of the effect of that statute be correct, it affords a defence to Wheeler as well as the other defendants. It is not pretended that he has used any machines not manufactured by them, or that he has infringed the plaintiff's rights, otherwise than by receiving from the other defendants the sum agreed to be paid by them on the sale of his machines.

I find, therefore, for the defendants.

[In this candid statement to the public, I should have preferred to have given the decision of the Judge and the findings of the Court in full, but for the great length of space they would occupy; and I will state that the same can be found in "Mining and Scientific Press," of December 19th and 31st, 1864, and invite their thorough perusal.]

It will be seen by the above statements that Mr. Varney is infringing on my patent right by the use of wide guide plates in his pans, instead of my infringing on his patent. The truth is, he never used any but narrow scrapers in his pans until after I had put my pans in operation, and they had proved a success. None of his pans made prior to the year 1863 ever run six weeks without being condemned and thrown aside. This may account for the fact that he afterwards altered his patterns and made them like mine, with an open, deep pan, and wide guide plates instead of scrapers, and put a wooden cover on the pans.

Having established my right in my patent Amalgamator, it is now my turn to protect myself against the infringement of "Mr. Varney, or any other man," and I intend to do it; and all persons are hereby warned not to purchase or use machines called "Varney's Amalgamators," as made at the Union Foundry, Pacific Foundry, or any other place, as they will make themselves liable for an infringement on my patent right.

Having made some important improvements in my Amalgamators, the public are invited to call and examine them at the Miners' Foundry, San Francisco, or at Prescott & Schiedel's Foundry, Marysville, where they are manufactured. ZENAS WHEELER.

San Francisco, Dec. 27th, 1864.

Astonishing Illegality of Mining Advertising.

The amount of mining corporation advertisements now being published in certain daily papers of this city in an illegal manner, and containing plain and gross violations of the recent Act concerning assessments of corporations, is really astonishing.

ADVERTISING IN SUPPLEMENTS has been decided by the Courts of the State of New York (after whose code the laws of California were framed,) as absolutely void; and we have the best of reasons for cautioning every prudent company against that class of advertising. Furthermore, there are continually numberless errors or discrepancies occurring, through MISAPPREHENSION OF THE LAW, on the part of advertisers.

We do not aim to raise unnecessary alarm, but simply perform our duty in admonishing parties interested against the storm of retribution, which is most surely awaiting the success of such companies as are now pursuing informal transactions, whether the same occur through carelessness, duplicity or ignorance.

The original bill for levying and collecting assessments, as first introduced before the last Legislature, we denounced as outrageous; as amended and passed, the Act is obnoxious and cumbersome to the mining community, and is rapidly preparing an enormous feast for the "legal fraternity" of this coast. Although very rigid, the law is no less specific in its main features, and when once minutely understood, its illiberal requisitions are very plain.

TO MINERS AND MECHANICS.

The publishers of this paper are making great efforts to establish, for the benefit of miners and mechanics, a journal which shall occupy on the Pacific coast a similar position to that filled by the *Scientific American* and the *American Artisan* in the Atlantic States. Our isolated position and peculiar necessities appear to require a journal quite distinct, in many particulars, from similar publications at the East. To meet this want we have established the MINING AND SCIENTIFIC PRESS. Here the miner, the mechanic, and the man of science, find themselves brought in closer contact and more dependant, each upon the other, than in any other locality on the globe. Hence we have endeavored to present this paper to this community of interest as a representative journal. In order to carry out the plan of our work as it should be done, we greatly need the assistance and co-operation of those for whose benefit it has been established. Every miner, every mechanic and many men of science to whose attention this paper is submitted, or who may, as a regular subscriber or by casual circumstance, hold this paper in his hand, should show it to his friends—the miner to his fellow-miners and the mechanic to his fellow-mechanics—and do what he can to induce them to join him in the support of a journal whose measure of usefulness will be in proportion to the liberality with which it is supported. The press, throughout the State, and the public everywhere, so far as we are informed, recognizes the value and importance of the MINING AND SCIENTIFIC PRESS to the great interests in California, to whose advancement it is pledged. It has now reached its tenth volume, and is established on a firm basis. Its publishers are desirous of still further improving its appearance and usefulness. Hence this appeal to its friends. The paper has just entered upon a new volume and the present affords a most favorable opportunity to commence your subscription. Numbers have already come in, since the commencement of the new volume, and we hope to add many more to our list ere we reach the close of another quarter. No better investment of money can possibly be made by the miner or the mechanic. The information contained in one volume of this paper is of many times more value than the cost of subscription—and worth far more than the information which the same amount of money will purchase in books.

Memorandum for Secretaries.

Safe Rules for Advertising.

Make your order levying the assessment on any day EXCEPT FRIDAY, and advertise the Assessment Notice on the FIRST FOUR succeeding SATURDAYS, setting the day for delinquent advertising on the FIFTH SATURDAY, and the day of sale on the SEVENTH SATURDAY, or any day thereafter, PREVIOUS to the EIGHTH SATURDAY.

ADVERTISING IN THE INTERIOR.—If the mine or works of the corporation are located in any State or Territory of the United States, notice must be advertised there also, if a newspaper is published in the same county. On this account, SATURDAY is the best day on which to levy assessments, as thereby the longest period possible is gained for transmitting a copy to interior papers, which are usually published on Saturdays.

POSTPONEMENTS.—The date set for advertising delinquent stock, and the day of sale mentioned in either notice, may be *once* postponed for any period not to exceed ten days. Secretaries can avail themselves of this privilege when assessments are levied on Friday and they are obliged to advertise at the mine on Saturday, or desire to publish on that day at the place of incorporation.

ERRORS, OMISSIONS, OR DELAYS are definitely provided for in Section 14 of the new law, whereby it is plain that, if the advertising is delayed, the Secretary can only fix the dates for delinquent advertising and sale to suit the time be is to advertise, and proceed anew.

WHEN PAYABLE.—It is the usual custom to make the assessment "payable immediately," or upon some date within a day or two from the time of levying the assessment, although the law makes no requisition as to this matter.

BLANKS FURNISHED FREE to advertisers in the MINING AND SCIENTIFIC PRESS, for Assessment Notices, Deliuquent Sales, Postponements, etc.; also copies of the Assessment Law of 1864. Copies of advertisements, for sending personal notice to shareholders, printed at $1 per hundred.

The PRESS is the most ECONOMICAL advertiser for stockholders, reliable and obliging for Trustees and Secretaries, and merits the patronage of the mining interests.

COPPER.—The present annual consumption of copper in this country is about 13,000 tons; of which amount about one half is derived from the Lake Superior mines. The balance is derived in ores from California, Chili, Cuba, etc. On the first of January, 1864, copper was quoted in Boston and New York at 39c. It advanced with the rise of gold to 56c in July, declined to 47c in September, and has since fluctuated, with the fluctuations of gold between 48c and 50c.

RICH ROCK FROM A NEW DISTRICT.—Eleven hundred pounds of silver ore from the Osceola ledge, Montgomery District, Esmeralda, worked at Kimball & Murphy's Metallurgical Works, on Bryant street, in this city, yielded $1,507. This was a sample, sent down as an experiment, the success of which will induce the Osceola company, and owners of other lodes in Montgomery District of the same character, of which there are quite a number, to develope their mines in a practical manner as rapidly as possible.

THE COAL OIL BUSINESS.—Mr Benoist, who has been employed in this city for the past two years in rectifying coal oil, and who is thoroughly acquainted with the nature of that important article, has fitted up an extensive laboratory at 643 Third Street, for the purification of the product of California coal oil wells.

GREAT as you may be the cradle was your world once, and over it, the only horizon you beheld, bent the heaven of a mother's eyes, as you rocked in that little barque of love.

KEEP YOUR MATCHES OUT OF THE SUN.—A box, about one foot square, and containing several gross of friction matches, exposed to the sun in the rear of Diamore's store, Yuba City, on Monday, ignited and "went off."

Quartz Ledge For Sale.

THE entire right, title and interest in a Quartz Ledge in this State is offered for sale. Abundant and reliable evidence of its richness, with further particulars, will be furnished to parties addressing, with real name, "J. H. W.," Lock Box 1,098, San Francisco Postoffice. 7v10

Boot-Blacking Machine.

This late "YANKEE INVENTION" has arrived in California, and can now be seen

At the St. Lawrence Hotel, Market Street.

This machine is a great labor-saving invention, and will be found of especial value in large hotels, and for use at all boot-blacking stands, etc. The public are requested to call at the St. Lawrence Hotel and decide for themselves with regard to its merits, rather than to make up their minds as to its value from some peripatetic news-reporter, who may be a better judge of tangle-leg whiskey than mechanical ingenuity. Rights to use this Machine for sale.

7v10 A. E. WHITE.

TREMENDOUS CAVE IN THE GOULD & CURRY MINE.—On the 8th inst. at about half-past eleven, P. M., ao immense cave occurred in this mine. It eame down suddenly, while all the men were in the mine at their usual stations, yet not one was injured. The length of the cave is about 100 feet, its width some 60 feet, and the depth to which it extended 375 feet. The *Territorial Enterprise* says it shook houses standing at a considerable distanee from the mine, causing furniture and glassware to rattle as though by the agitation of an earthquake. The eave injured nothing in the mioe; and on the 9th the usual amouot of ore was taken out, all the men being at work, and everything going on as though no cave had oecurred.

MINING IN SOUTHERN CALIFORNIA.—Late letters from Arizona state that matters are somewhat looking up. The fuller development of the permanent mines is coosiderably retarded by the enormous rates of freight. It is said that many leads, offering good paying ore, would yield a great trade with San Franciseo, if freights down the Colorado were cut down one half. The uncertaioty as regards the time of the passages of the steamers up and down, is said to be aoother great drawbaek. Ore saeks are also very searce. The great stoek sent dowu during the excitement, some twelve months ago, are nearly all used up, and the mines now shipping ore have the greatest difficulty in getting sacks.

TO MAKE SHIRT-BOSOMS SHINE.—Take two ouoces of gum arabie powder, put it into a piteher, and pour on it a pint or more of boiling water (aecording to the degree of strength you desire), aod then, having covered it, let it stand all night. In the morning pour it carefully from the dregs into a eleao bottle, cork it for use. A tablespoonful, of gum water, stirred in a pot of starch that has been made in the usual maouer, will give the linen a beautiful lustre.

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alteration, which they may desire made in their advertisements, at their earliest convenience. New advertisements should be sent in as early as possible.

For Advertising Assessments on Saturdays.

Levy your Assessments upon any day EXCEPT FRIDAY.

Advertise the ASSESSMENT NOTICE on the FIRST FOUR SATURDAYS succeeding the day upon which the assessment is levied.

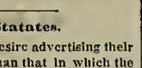
Appoint the day for advertising the DELINQUENT SALE on the FIFTH SATURDAY succeeding the date of levying the assessment.

Appoint the DAY OF SALE on the SEVENTH SATURDAY succeeding the date of levying the assessment, or any day *previous* to the Eighth Saturday.

Assessments ordered upon Saturday afford the Secretary the longest term in which to effect his advertising at the mine.

Extracts from the Statutes.

The attention of companies who desire advertising their delinquent sales in any other paper than that in which the notice of assessment appears, is called to the following section of the law approved April 4th, 1864:



Section 7. If any portion of the assessment mentioned in said notice shall remain unpaid on the day specified therein for the publication of the notice of sale, the Secretary shall, *unless otherwise ordered by the Board of Trustees*, cause to be published in the same papers in which the notice provided for in section five shall have been published, a notice substantially as follows, &c.

If, from a matter of convenience or necessity, the publication of an assessment is delayed, a very simple remedy is found in the following section of the law, relating thereto:

Section 14. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the nonperformance of any act required to be performed in order to enforce the payment of the same; but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall be void, and publication shall be begun anew

MINERALS FROM SALT LAKE.—The Stockton *Independent*, of a late date says that Dr. Holden, of that city, has received a box from Salt Lake City, containing one hundred and thirty-nine pounds of auriferous rock, embracing specimens of salt, silver, copper, antimony, iron and lead ores, etc.; also, sulphurets of the various metals, carbonate of copper, and specimens of petrified wood. These samples were sent by Dr. Reid, formerly of Stockton, at present residing at Salt Lake. Accompanying these specimens were bars of silver and lead from Rush Valley Smelting Works. The various rocks represented the ores found at Cedar Mountain, Jordan and St. Louis mines (carbonate of copper), Vedette Copper mine, and Rush Valley Silver Mine; also silver ores from Sublett's Cut-off, Somora, Russian River, Dacotah, Washita Mountain, Empire, Lone Star, Lady Grant, and many other mines. Some of the silver ores are marked as yielding seven hundred dollars per ton; and among the contents of the box are beautiful samples of volcanic rock. These evidences of the mineral wealth of the places they represent are valuable acquisitions to any cabinet.

A YOUTHFUL NIMROD.—The French Imperial Prince, only 8½ years old, went a shooting recently with his father, and killed three pheasants and four rabbits.

IMPORTANT DISCOVERY
— IN THE —
Photographic Art.

Jacob Shew's
CHROMATIC PROCESS OF PRINTING PHOTOGRAPHS.

[PATENT APPLIED FOR.]

THE UNDERSIGNED WOULD ANNOUNCE TO THE public that he has discovered a new and IMPROVED PROCESS for printing Photographs, which produces a

SOFTNESS, CLEARNESS AND DELICACY OF TONE

unattainable by any other known process and to which he has given the above name. It is applicable to any size of Photograph, and those having valuable old negatives which they desire printed by the improved process can do so at any time.

In order to secure the pecuniary advantages to be derived from this important discovery a patent has been applied for. When obtained, the privileges of the right will be disposed of at a reasonable rate to any Photographer desiring it. In the meantime all are warned against encroachments upon the rights of the discoverer as such will be prosecuted to the full extent of the law.

"Cartes de Visite" and large Photographs printed by this process will be furnished at the prices of the ordinary work of other establishments.

☞ The public are invited to examine specimens at my Gallery. ☜

Machinery.

WM. BRUCKNER'S
Furnace for Roasting Ores,

Now in Operation at 416 Market street.

This Furnace, which is portable, and can be carried on muleback, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an Iron Cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most

Economical and Practical Invention.

The furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three-fourths of a horse power for the smaller size. Parties wishing to erect such furnaces will please communicate to

W. BRUCKNER,
5v10 No. 416 Market Street, San Francisco.

IMPORTANT INVENTION.
Hunter's Concentrator, Amalgamator and Separator.

For the concentration of Gold, Silver and Copper ores, and separating all kinds of metals from the sands, where the specific gravity of the metal is greater than that of the rock, a machine is now on exhibition at No. 521 Market st., above First, at HACON & WEBSTER'S Quartz Grinding Works, where it will be running from two to three o'clock P. M., for the inspection of all interested in mining. The inventor is prepared to manufacture machines to supply all orders promptly. The sixth of a horse power is sufficient to run one of these machines. For the above machine a patent has been applied for. Orders for machines, or for circulars and further information, should be addressed to

ANDREW HUNTER, Inventor.

The following extracts from Reports are submitted to the public as giving the results of a fair working test of these machines:

BEAR VALLEY, DEC. 12, 1864.

MR. A. HUNTER—*Dear Sir:* I take pleasure in stating, in reply to your request, that your concentrator has now been running uninterruptedly, at Princeton Mill, for more than three weeks, and the enclosed notes, by the Superintendent Mr. Williams, of a carefully measured test of its performance during a period of a day and three quarters, I believe fairly indicates what it has been doing through the whole of that time. First, the loss of the sulphurets, per cubic foot of tailings from the Concentrator, was about one-tenth of an ounce. Second, the loss of sulphurets from the blankets was nearly *fifteen times greater* than that from the Concentrator. The Concentrator has not been found at any time in the slightest manner out of order, and has required scarcely any attention. Congratulating you upon the these facts, I am, sir, very respectfully yours, FRED. LAW OLMSTAD,
Manager Mariposa Company.

Notes of test run of Hunter's Concentrator—it having been supplied during the test with the sands reduced by one battery of the Princeton Mill, in the condition in which they are usually received by the blankets:—

Running time	1¾ days.
Amalgam saved on the plates of the Separator during above time, value	$6 75
Rate of saving of single machine per day	3 86
Rate of saving of six machines per day	23 16
Yield of Sulphurets, 1¾ days, pounds	215
Yield of Sulphurets, one days run of one Machine	123
Rate per day of saving from six machines, being the whole number required for the Princeton Mill	738
Yield of amalgam from plates of Separator, per ton of rock crushed, value	55
Yield of sulphurets from Separator per ton of rock crushed, pounds	16

HANNIBAL WILLIAMS,
Superintendent Princeton Mill.

SAN FRANCISCO, DEC. 18, 1864.

I have recently examined one of Hunter's Concentrators and Amalgamators, in operation at the Princeton Mill, Mariposa Estate, the sands and crushed rock, flowing from one battery of four stamps, passing directly over the machine, without using blankets. On examination, it shows conclusively that the loss of sulphurets by the machine is much less than by the blankets, being but a mere fraction of the sulphurets, consisting of the light and thin scales, such as can scarcely be saved by panning; while on the other hand the tailings from the blankets contain a large amount of heavy sulphurets. The product of the machine is almost pure, clean sulphurets—the copper plates of the machine, being amalgamated, securing much or all of the free gold that escapes the battery. I witnessed the cleaning up of the machine, and the collection of a ball of amalgam. From the weights taken we may state the constitution of this ore, as it came from the batteries at that time, as follows:

Clean Sulphurets containing free gold and amalgam	18.00
Quartz sand, waste	1981.78
Loss of Sulphurets and tailings	.22
Total	2000.00

WM. P. BLAKE,

How to Clean Copper Plates.—It is well known that the mercury lined copper plates employed for saving gold in quartz mills, after long use become thickly coated with amalgam, so firm as to render it impossible to remove it by the ordinary means employed for such purposes. Mr. Howell, of the Donnebroy Mine, Brown's Valley, says the Marysville *Appeal*, recently originated quite a novel process of recovering this hard amalgam from the plates. He took up his plates and put them through cylinders, such as are used by tinmen for shaping tin plate. This rounding of the plate loosens and breaks up the amalgam, which after a while has become almost as fine as the the copper itself, and as thick as ordinary card board. The result of this "clean up" of his plates realized $800. The Jefferson Mill, in the same neighborhood, next cleaned up $2,800 in like manuer. The Pennsylvania then followed, but did not report the result. The *Appeal*, however, estimates it at fully as much as the Donnebroy. The hint may be useful to others. Any further accumulation of amalgam upon plates, after a slight coating has been formed, is useless, and a mere profitless accumulation of capital.

The Gould & Curry Mine.—The tota number of men employed, at present, in and about the mine is 215; extracting ore, 79; prospecting, 11; accessory work, 59; on improvements, 20; carpenters, 25; blacksmiths, 7; outside laborers, 14. The ore taken out daily amounts to about 130 tons, and averages from $90 to $500.

Send in Your Subscriptions!

A New Volume of the Press commenced on the 7th of January, and now is the time to renew your subscriptions. If you believe in supporting our paper, send us in your own subscription, and as many of your neighbors' names as possible.

Inventors and Inventions.—Let us not cheapen inventions, but be kind to the inventors; beware of killing the gooso that lays the golden egg! Many inventors die before the hour of triumph; others falter by the way. Invention is a struggle, a conflict, almost a battle; if the victors are rewarded, the dead are honored and the wounded carefully attended to. Glorify the inventors who succeed; cover with an indulgent self-respect the faults of those who fail; and soothe the last years of the wounded—those invalids of industrial science who have known only the pains of the fight, and always remained ignorant of the joys of victory. —[Dumas.

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating: also, for crushing Quartz for Arastras and Grinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water, or Steam Power. For further information address W. W. HANSCOM.

1 Golden State Iron Works, San Francisco.

FARRAND'S
Oscillating Amalgamator,

RECEIVED THE

ONLY PREMIUM

AWARDED FOR AMALGAMATORS

At the Recent Industrial Fair

OF THE

Mechanics' Institute of San Francisco.

Committee of Awards.

O. Belden, O. Ooni, W. T. Garratt, Geo. Johnson, H. P. Wakelee, C. M. Ranclaff.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

W. D. FARRAND, Inventor,

R. L. OGDEN, Agent, SAN FRANCISCO.

SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

Pacific
BEATER PRESS
Company.

San Francisco, California.

This Company are prepared to manufacture and sell the celebrated PORTABLE BEATER PRESS, so well known in the East, where it has, in the short space of two years, almost entirely superseded all other

HAY AND COTTON PRESSES.

This Press is easily moved from place to place, requiring only two span of horses over any ordinary road; is worked with great facility by steam or water power; and two men with a span of light horses in ten minutes time will turn out a bale of hay, in dimensions measuring three feet eleven inches in length, twenty-two inches width, and from twenty-four to twenty-eight inches in depth, and weighing from four hundred to five hundred pounds.

The fact that Beater Pressed hay commands a BETTER PRICE in market than any other, is substantiated by the market quotations of New York and other Atlantic as well as Western cities. Hay baled with this press is much cleaner than that baled by any other in use, being completely freed from all dust by the action of the beater, besides being so compactly pressed as to be fire and water proof.

This press is equally efficient for Cotton, Wool, Pulu, Tow, Hemp, Hair, Manilla, Oakum, Hops, Rags, Shavings, &c. No other Press can make so good a bale of cotton, and make it retain its compact shape. Parties interested are invited to call and see one in operation.

Office and Warehouse—MISSION STREET, between Main and Beale streets.

W. H. MITCHELL,

2v10 **General Agent.**

HUNT'S
IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

For Sawing Wood,

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

Disney's Cylinder Amalgamator.
The Cheapest and Best.

Disney's cylinder amalgamator, which has recently been introduced to the public, has already been proved a complete success, and can be furnished, at a price cheaper than any other in use. It is simple in construction, and so arranged as to do a large amount of work with the smallest expenditure of power. The proprietor is satisfied that he can do more work in a given time and with a given expenditure of power than any other amalgamator in use. For small companies who desire cheap yet effective machines, none can be more desirable.

It may be seen in operation at the Rail Road Foundry on Fremont street where

A NEW CRUSHER

Is in operation and he can crush and Amalgamate at the LOWEST RATES. Miners and all others interested are invited to call and examine for themselves.

M. DISNEY, Patentee.

San Francisco, June 23, 1864. 1-3m

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v10 San Francisco.

THE NOVELTY.

This ROTARY CYLINDER GRINDER & AMALGAMATOR *did not receive* the premium at the Industrial Exhibition. The one there displayed worked one hundred pounds at a charge, and was classed merely as a model, honorable mention of which being made by the committee. The inventor is now manufacturing some of the larger size of this machine, capable of working Two Thousand Pounds at a charge, and requiring no more power than is necessary for the pans now in use working but one-third that amount. This machine is simple in construction, durable and compact, very easy to clean up, and, in fact, is a perfect machine.

In offering his Amalgamator to the mining public the Inventor does not claim to have found the "Philosopher's Stone," nor any new method of extracting the precious metals from the ores, but does claim, as a practical mechanic and worker on mining machinery, that there was room for improvement in that direction, and that he has, by careful study, invented the improved ROTARY CYLINDER GRINDER AND AMALGAMATOR, known as the "NOVELTY," which mechanically overcomes the many difficulties that have heretofore arisen in the art of amalgamating ores.

This invention consists of a cylindrical-shaped case placed horizontally on legs, and provided with dies one and a half inches thick, making seventeen square feet of grinding surface, and having a rotary oblique muller (one or more) placed within it, and covered with shoes one and a half inches thick, and so constructed that all particles of rock must pass between the shoes and dies, causing it to be thoroughly reduced. The process of amalgamation is similar to that of the Gorman Barrel, but much more rapid than that or any other amalgamator, as the muller gives three distinct motions to the pulp in one revolution. Heretofore, the chief objection to cylinder amalgamators has been the great wear and friction to which the journals were subject; but in this amalgamator that difficulty has been entirely overcome by the use of an adjustable metallic box, a new invention, that acts for the double purpose of a metallic packing and a journal box, and works to perfection.

This machine, when seen working will convince any practical man of its superiority over all others, and the public in general, and Miners and Millmen in particular, are invited to call and examine these machines, now in operation at the Miners' Foundry, where they are now being manufactured. Address, Miners' Foundry, San Francisco, Cal.

H. L. HOPKINS,

1v10 Inventor and Patentee.

DUNBAR'S
PATENT SELF-ADJUSTING
Piston-Packing.

Requires no Springs or Screws; Is always Steam Tight, without excessive friction, and never gets slack or leaky.

It will save each season many times its cost in friction, time, steam and power. No engine, old or new, should be without it. It can be easily fitted to old or new Pistons.

Having obtained the Agency of this VALUABLE IMPROVEMENT, I am prepared to furnish it wherever desired. For further information, address HENRY S. SMITH,

23v8 Golden State Iron Works, San Francisco.

HUNT'S NEW DITCHER.

Having secured from the inventor the sole right to manufacture these Machines for the States of California and Oregon, and the Territory of Washington, I am now prepared to receive and promptly fill orders for these machines.

With the aid of three men and four horses this Machine will cut a ditch from two to three feet deep, as may be desired, dumping the earth all on one side so as to form a dike or embankment. For particulars send for circular, to

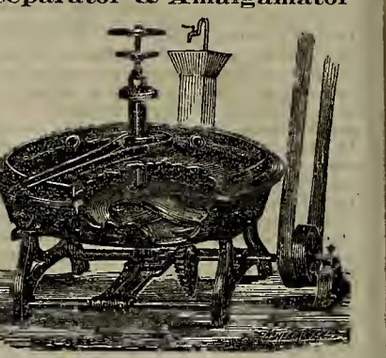
E. O. HUNT,

Windmill Builder, No. 28 Second Street and 110 & 112 Jessie Street, San Francisco. 9v22tf

SALMON'S
PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

No.	Fine	No.	Fine
Assay.....293	943	Assay.....300	990
Assay.....285	941	Assay for Czolman	980
Assay.....286	940	Assay Water Rock	966
Assay.....291	950	Assay Water Rock	998
Assay.....		St. Helena Ledge, W. D.	966



These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,

To whom all orders should be addressed. 15

BAUX & GUIOD'S
Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refines, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

Hepburn & Peterson's
AMALGAMATOR.

The subscribers would call the attention of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. The fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. between 3d and 4th.

[Illustrated in the Mining and Scientific Press, April 9th, 1864.] HEPBURN & PETERSON.

NOTICE TO MINERS.
NEW QUARTZ MILL.

The attention of all engaged in minino is called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast amalgamate, assort, enpelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallorgist. **B. FAUCHERY,** Engineer,

24v9

TO QUARTZ MINERS.
Hinkle's Centrifugal Pulverizer and Amalgamator!

The attention of miners is respectfully requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15-1m

PRATER'S
PATENT CONCENTRATOR.

The proprietors of this new Concentrator, having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.

San Francisco, April 1st, 1864. 14v8-tf

New Mining Advertisements.

Alta Coal Mining Company, Clayton District.
Contra Costa county, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 13th day of February, 1865, an assessment of fifteen cents per share was levied upon the Assessable Stock of said Company, payable immediately in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 18th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 1st day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

A. MARTINON, Secretary.

Office, 311 Montgomery street, up stairs, San Francisco. 7v10

Harmon Gold and Silver Mining Company,
Placerville, El Dorado county, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 15th day of February, 1865, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold or silver coin to the Secretary, at the office, No. 723 Montgomery street, up stairs.

Any stock upon which said assessment shall remain unpaid on Saturday, the 18th day of March, 1865, will be advertised on that as delinquent, and unless payment shall be made before, will be sold on Saturday, the 1st day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

T. J JONES, Secretary.

Office, No. 723 Montgomery street, San Francisco. 7v10

Keokuk Gold, Silver and Copper Mining Company, Clayton Mining District, Contra Costa county, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 16th day of February, 1865, an assessment of 7½ cents per share was levied upon the capital stock of said Company, payable on the 18th day of February, 1865, in United States gold coin, to the Secretary, at his office, No. 224 Clay street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 18th day of March, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 3d day of April, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

A. B. WINEGAR, Secretary.

Office, 224 Clay street, San Francisco. 7v10

La Paz Town Association, La Paz, Arizona Territory.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 17th day of January, 1865, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
J H Titcomb	7	25	$12 50
J H Titcomb	8	25	12 50
J H Titcomb	9	50	25 00
J H Titcomb	10	50	25 00
J H Titcomb	11	50	25 00
James A Mars	14	200	100 00
A Rosenfield	15	100	50 00
J B Frisbie	23	100	50 00
J B Frisbie	24	100	50 00
J B Frisbie	25	100	50 00
J B Frisbie	not issued	200	100 00
Wm Harwood	not issued	100	50 00
Wilbur Curtiss	not issued	200	100 00
P Banning	not issued	200	100 00

And in accordance with law, and an order of the Board of Trustees, made on the 17th day of January, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at public auction, at the Company's office, 528 Clay street, San Francisco, California, on the 7th day of March, 1865, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

B. W. MUDOE, Secretary.

Office, No. 528 Clay street, San Francisco, Cal. 7

Mount Davidson Gold and Silver Mining Company, Virginia District, Storey county, Nevada.
